Re: MVD Supply Wells 4 and 5 Investigation – Saint-Gobain Performance Plastics Site (DES#199712055-36430)

Dear Ms. Atwell:

On behalf of our client Saint-Gobain, attached to this letter is the report describing the investigation conducted in the vicinity of Merrimack Village District water supply wells MVD-4 and MVD-5 and the Longa Disposal Area in Merrimack, NH.

Please contact me by phone at (952) 832-2691 or email at jgreer@barr.com if you have any questions.

Sincerely,

Acronym	Description
CSM Report	Separate report titled: Conceptual Site Model of PFOA Fate and Transport: Merrimack, New Hampshire, to be submitted at a later date
LDA	Longa Disposal Area
MVD	Merrimack Village District
MVD-4/5	Merrimack Village District Wells 4 and 5
NHDES	New Hampshire Department of Environmental Services
ng/g	nanogram per gram, typical reporting units for analyses of PFOA in soil, equivalent to ppb
ng/L	nanogram per liter, typical reporting units for analyses of PFOA in water, equivalent to ppt for water samples with a density of 1 gram per centiliter (i.e., low total dissolved solids)
PFOA	Perfluorooctanoic acid
PFOS	Perfluorooctanesulfonic acid
PFHxA	Perfluorohexanoic acid
PFHpA	Perfluoroheptanoic acid
PFBA	Perfluorobutanoic acid
PFBS	Perfluorobutane sulfonate
PFPA	Perfluoropentanoic acid
ppb	Parts per billion
ppt	Parts per trillion

1.0 Executive Summary

A groundwater investigation of the Merrimack Valley District (MVD) wells 4 and 5 was conducted to characterize the presence of PFAS compounds in the vicinity of these wells and to better understand groundwater flow paths to the wells under various historical pumping conditions, including whether the Longa Disposal Area is a likely source of the PFAS compounds detected in the wells.

A work plan was developed and executed that included detailed soil profiling and sampling, groundwater sampling from soil probes, sampling of existing wells, groundwater and surface water elevation measurements, and comprehensive groundwater-flow modeling to match historical pumping conditions and recently measured groundwater elevations.

This investigation found the following:

- PFOA flowed to MVD wells 4 and 5 via groundwater from areas west and northwest of the MVD wells. Under non-pumping conditions, the groundwater flow paths from areas to the northwest would likely not have intersected the MVD wells. However, pumping of MVD wells 4 and 5 over time would have changed the groundwater flow directions and "pulled to the southeast" groundwater from this area.
- The Longa Disposal Area is not ruled out as a contributor of PFAS but it is likely not a significant contributor to MVD wells 4 and 5. Groundwater modeling indicates that the total flow of groundwater from underneath the Longa Disposal Area is up to approximately 15 percent of the total volume of water pumped by MVD wells 4 and 5 under summertime (high demand) rates. At lower pumping rates and under non-pumping conditions, groundwater passing underneath the landfill is not predicted to flow to the MVD wells. Volatile organic compounds (compounds that are typically associated with mixed-waste landfills) were found in the landfill's monitoring wells during previous investigations and a few volatile organic compounds were reported at concentrations near or below the reporting limits in two of the Longa Disposal Area monitoring wells sampled for this investigation. Volatile organic compounds were not detected in groundwater samples in monitoring wells or soil probes in the vicinity of MVD wells 4 and 5, except for a few detections at or below the reporting limit, nor were they detected in multiple samples collected from MVD wells 4 and 5 under pumping and non-pumping conditions.
- The water level data, along with the groundwater modeling results and regional studies, indicate that there is not a groundwater migration pathway parallel to the Merrimack River north of the MVD well field area. Direct migration of PFOA from the SGPP facility to MVD wells 4 and 5 is highly unlikely and not supported by the data.
- PFOA and other PFAS compounds were not detected in most of the unsaturated soils that were sampled in the vicinity of MVD wells 4 and 5 as part of this investigation and the few PFAS compounds that were detected were at very low concentrations. These results suggests that there is not an aerially deposited source of PFAS in the vicinity of wells MVD-4 and MVD-5.
- The fraction of Merrimack River water pumped from wells MVD-4/5 is estimated to range from 0 under long-term average pumping conditions to 12 percent under summer pumping conditions

with normal recharge rates and river stages. The majority of the water pumped by wells MVD-4/5 originates from the west and northwest. The bedrock contributes some water to the wells as it discharges into the alluvial aquifer from the west. Baboosic Brook is also a contributor to flow to the wells and there is a component of flow that reaches the wells from areas west of Baboosic Brook.

- There are many current and historical property uses near wells MVD-4/5 and the Longa Disposal Area that have been identified through review of readily available records as potential sources of PFAS to groundwater. These uses include, but are not limited to: car wash, auto detailing, upholstery cleaning, granite, stone and tile fabrication, and printing. Other sources will likely be identified as more information on PFAS usage becomes available. PFAS from such sources in upgradient portions of the capture area for wells MVD-4/5, including areas to the west of Baboosic Brook, could migrate from the source areas to wells MVD-4/5 wells and may be contributing to the overall concentrations and detections of the various PFAS in wells MVD-4/5.

2.0 Introduction

This report describes the investigation of the presence of poly- and perfluoalkyl substances (PFAS) in the Merrimack Village District's (MVD) water supply wells 4 and 5. The primary PFAS being evaluated is perfluorooctanoic acid (PFOA), although other PFAS compounds such as perfluorooctanesulfonic acid (PFOS), perfluorobutane sulfonate (PFBS), perfluorobutanoic acid (PFBA), and perfluoroheptanoic acid (PFHpA) have been detected in MVD wells 4 and 5 and residential wells in the area. The New Hampshire Ambient Groundwater Quality Standard (NHAGQS) for PFOA+PFOS is 70 ng/L (70 ppt).

Sampling of residential water-supply wells in the Merrimack area by the New Hampshire Department of Environmental Services (NHDES) has found varying levels of PFOA and other PFAS compounds in a general pattern with highest concentrations in the vicinity of the Saint-Gobain Performance Plastics (SGPP) facility (Facility) in Merrimack, New Hampshire. The location of the Facility is shown on Figure 1. SGPP uses dispersions that contain PFAS in the manufacture of films and coated cloths. In the past, the Facility applied coatings to fabrics in which PFOA was an ingredient in the dispersion used during production. PFOA was emitted from the Facility's stacks as part of the process. The primary source of PFOA in the Facility was a component of raw materials purchased from suppliers. These types of materials have been commonly used in a wide range of applications in many industries. Pursuant to the terms of the EPA's Voluntary Stewardship Agreement, from 2006 to 2015, suppliers of raw materials to the Facility undertook the process of phasing out the use of PFOA.

PFOA, PFOS, and other PFAS compounds have been used by many companies in the manufacture of many commercial materials for industrial, commercial, and residential use, including stain-resistant carpeting/furniture, non-stick cookware, food package coatings, aqueous fire-fighting foams (AFFFs), moisture-resistant breathable fabrics, concrete and rock sealants, electrical capacitors, dyes, paints, batteries, and as a vapor suppressor in metal plating processes. They are a ubiquitous presence in most households and are found in municipal waste streams and in most landfills (Busch et al., 2009; MPCA, 2009). They are also found in biosolids (in part from municipal sewer sludge) used as amendments to soil in agricultural and landscaping applications.

The area near the Facility has been identified by the NHDES as one of several areas of interest in southern New Hampshire for the investigation of PFAS impacts to groundwater. NHDES collected water samples from water wells in the area beginning in early 2016 and is ongoing. The results of the NHDES sampling of area water wells, including MVD water supply wells 4 and 5 (MVD-4/5), conducted between March 2016 and early January 2017, for PFOA and PFOA+PFOS are summarized on Figures 2 and 3, respectively.

Some of the PFOA detections and concentration in wells in the Merrimack area generally conforms to airborne deposition and subsequent infiltration/migration through the unsaturated zone to the water table. Detections of PFOS and most other detected PFAS compounds in wells do not conform to this pattern, indicating that there are likely many diverse sources of PFAS compounds to groundwater in the area. The source of the airborne PFOA deposition is likely due, in part, to air emissions from the Facility. Preliminary coupled air and groundwater modeling currently in process by Barr Engineering Co. evaluates this pathway, and provides an explanation for some, but not all, of the PFOA detections in well samples.

The air dispersion pathway does not explain the detections of PFOA or most other PFAS compounds detected in wells. The preliminary modeled annual average air deposition rate around the Facility is also shown on Figures 2 and 3.

The preliminary air dispersion modeling (Barr Engineering Co., 2017) indicates that wells MVD-4/5 are not within the area where air deposition from the Facility would have exceeded levels that would result in groundwater concentrations above 70 ppt. However, wells MVD-4/5 are directly adjacent to a closed landfill – the Longa Disposal Area. Four monitoring wells at the landfill have detections of PFOA, with measured concentrations of up to 130 ppt. The Longa Disposal Area was a suspected source for PFOA and other PFAS compounds detected in wells MVD-4/5, given their close proximity to the edge of the landfill and because landfills are known sources of PFAS contribution to groundwater.

Barr Engineering Co., on behalf of SGPP, proposed a scope of work to evaluate the source of PFAS in the vicinity of wells MVD-4/5 (Barr Engineering Co, 2016a). Following NHDES comments on the draft scope of work (NHDES, 2016), a final scope of work was submitted to NHDES on October 20, 2016, titled: Proposed Investigation Scope of Work: MVD Supply Wells 4 and 5, Merrimack, NH – REVISED (Barr Engineering Co., 2016b). This proposed scope of work included detailed soil and groundwater profiling in the vicinity of the well field and landfill, sampling of existing monitoring and water supply wells, sampling of Baboosic Brook and the Merrimack River, and development of a calibrated groundwater flow model to assist in understanding where wells MVD-4/5 get water when pumping at various reported rates. This report describes the results of the study.

2.1 Wells MVD-4/5

Wells MVD-4/5 are located approximately 800 feet (MVD-5) and 1,100 feet (MVD-4) north-northeast of the Longa Disposal Area (Figure 1). The wells are screened in unconsolidated alluvial deposits consisting mainly of sand and gravel and are within approximately 1,100 feet of the Merrimack River. Well MVD-4 was constructed with a 10-foot long screen in the unconsolidated sediments. The well is screened in the depth interval 43 to 53 feet below ground surface. Well MVD-4 began operation in 1956. Well MVD-5 was constructed with a 15-foot long screen in the unconsolidated sediments. The well is screened in the depth interval 50 to 65 feet below ground surface. Well MVD-5 began operation in 1969. Historically, wells MVD-4/5 have been used to supplement water to the system primarily during the summer months when demand is typically high. Well MVD-4 was taken offline May 21, 2015. Well MVD-5 was taken offline April 26, 2016. Wells MVD-4/5 were deactivated on June 7, 2016 due to detections of PFOA and/or PFOA+PFOS above 70 ppt in the wells.

2.1.1 PFAS in the Wells MVD-4/5 Area

PFAS have been detected in water samples from wells MVD-4/5. The MVD wells were sampled regularly by MVD/NHDES for PFASs between March 2016 and July 2016. Between March and July 2016, analytical results for samples collected from wells MVD-4 and MVD-5 were as follows:

- MVD-4
    - Highest PFOA concentration: 130 ppt on 5/5/2016
    - Lowest PFOA concentration: 11 ppt on 5/19/2016
    - Highest PFOS concentration: 11 ppt on 5/5/2016
    - Lowest PFOS concentration: non-detect at 4 ppt on multiple dates
    - Other PFAS detected include: PFBS, PFHpA, PFHxS, and PFHxA,
- MVD-5
    - Highest PFOA concentration: 79 ppt on 5/12/2016
    - Lowest PFOA concentration: 21 ppt on 6/2/2016
    - Highest PFOS concentration: 5.5 ppt on 4/14/2016
    - Lowest PFOS concentration: non-detect at 4 4 ppt on multiple dates
    - Other PFAS detected include: PFBS, PFHpA, PFHxS, and PFHxA,

In April 2016, four monitoring wells in the vicinity of wells MVD-4/5 were sampled for PFAS on behalf of the NHDES by Sanborn, Head & Associates, Inc. (SHA). Wells sampled included 45-1MW, 45-3A, 45-9, and 45-10 (see Figure 4). The sampling results (SHA, 2016) showed the following:

- The highest PFOA concentration of 140 ppt was reported in the sample from well 45-3a, which is located east-southeast of well MVD-4. Based on the groundwater flow direction inferred by SHA, well 45-3a is located downgradient of well MVD-4.
- The highest PFOS concentration of 11 ppt was reported in the sample from well 45-11, which is located south of well MVD-5 and north of the Longa Disposal Area. Based on the groundwater flow direction inferred by SHA, well 45-11 is located side-gradient to well MVD-5 and the Longa Disposal Area.
- The lowest PFOA concentration of 31 ppt was reported for the sample from well 45-1MW, which is located west of MVD-4 and northwest of MVD-5. No PFOS was reported in this sample. Based on the groundwater flow direction inferred by SHA, well 45-1MW is upgradient of wells MVD-4/5.
- Other PFAS reported in one or more of the groundwater samples collected from the monitoring wells in the vicinity of well MVD-4/5 include PFPEA, PFBS, PFHxA, PFHPA, and PFHxS.

2.1.2 Source Water Protection Area

A Source Water Protection Area (SWPA) report for well MVD-4/5 was prepared in 2003 by Emery & Garret Groundwater, Inc. (EGGI, 2003). Emery & Garret Groundwater, Inc. delineated the source water protection area (SWPA) for MVD-4 and MVD-5 using water levels and pumping test response data (EGGI, 2003). The SWPA represents an approximate area of groundwater contribution to the wells, based on the requirements for delineating SWPAs. The purpose of SWPAs is to conservatively delineate where a well or wellfield derives its water so that steps can be taken, as necessary, to manage existing or potential contamination sources on the landscape within the SWPA. The SWPA for wells MVD-4/5 encompasses the northern portion of the Longa Disposal Area. When wells MVD-4/5 are pumping they capture groundwater from within the SWPA. When the wells are not pumping, groundwater beneath the northern portion of the Longa Disposal Area likely flows east to the Merrimack River. EGGI (2003) noted that a significant amount of the volume of groundwater that is pumped by wells MVD-4/5 likely comes from the south. This is also where the Longa Disposal Area is located in relation to well MVD4/5. EGGI (2003), in

their delineation report for the SWPA, estimated that 30-35% of the water pumped from wells MVD-4/5 originates from the Merrimack River and Baboosic Brook.

2.2 Longa Disposal Area

The Longa Disposal Area is located to the south-southwest of wells MVD-4 and MVD-5 (Figure 1). Prior to being used as a waste disposal area, the site was used as a borrow pit for sand and gravel and a waste burning pit (HTA, 1989). Waste materials in the disposal area reportedly include mixed municipal solid waste, stumps, demolition waste, and masonry rubble. Waste disposal activities ceased at the site in 1987 (HTA, 1989).

Municipal and mixed solid-waste landfills are known to be sources of PFOA, PFOS, and other PFAS compounds (e.g., Busch et al., 2009; MPCA, 2009) in groundwater. The source of PFAS compounds in landfills is attributed mainly to commercial and consumer materials that contain or were treated with PFAS-containing substances, such as carpeting, furniture, cleaning residues, dyes, and food wrappers.

Currently, portions of the former Longa borrow pit are being reclaimed. According to a recent permit application (Brighter Horizons Environmental, Inc., 2013), reclamation activities involve importing fill consisting of waste-derived products including:

- Urban fill: Soil from urban or developed sites that has the potential to contain residual levels of chemicals
- Street Sweepings and Catch Basin Cleanings: Street sweepings, roadside ditch soils and catch basin cleanings that do not obviously contain wastewater, animal wastes, oil, gasoline or other petroleum product
- Other Impacted Soil: Dredged spoils or soil from known impacted sites with residual levels of chemicals that are acceptable for reuse at the Site. These soils include street sweepings or catch basin cleanings that have obvious or known chemicals.

According to the reclamation plan for the Longa borrow pit (AMEC, 2013), these fill materials will be placed to the south of the existing Longa Disposal Area.

2.2.1 PFAS in Groundwater at the Longa Disposal Area

In April 2016, selected monitoring wells around the Longa Disposal Area and in the vicinity of wells MVD-4/5 were sampled for PFAS for the NHDES by SHA. The sampling results (SHA, 2016) indicated the following:

- Concentrations of PFOA in the Longa Disposal Area monitoring wells ranged from 33 ppt at well LNG-MW-2 to 130 ppt at well LNG-MW-1.
- Concentrations of PFOS in the Longa Disposal Area monitoring wells ranged from non-detect at 4.2 ppt (wells LNG-MW-1 and LNG-MW-2) to 41 ppt at well LNG-MW-4.
- Well LNG-MW-1 is located near the southeastern corner of the disposal area and well LNG-MW-4 is located on the east side of the disposal area (Figure 4). Wells MVD-4/5 were not pumping when the sampling was performed. SHA inferred the groundwater flow direction at the time of the sampling to be to the southeast toward the Merrimack River. The sampling results combined with

the groundwater flow direction inferred by SHA indicate that the highest PFOA+PFOS concentrations in groundwater were directly downgradient of the Longa Disposal Area.

- Monitoring well LNG-MW-2 is on the west side (upgradient) of the disposal area (Figure 4). The reported concentration of PFOA in the groundwater sample from this well was 33 ppt.
- LNG-MW-4, on the east and downgradient side of the disposal area, had the highest PFOS concentration at 41 ppt, as well as a PFOA concentration of 89 ppt. PFOS was not reported above the detection limit on the west side (upgradient) of the disposal area and PFOA was detected at a concentration of 33 ppt. This suggests that the Longa Disposal Area may be a source of PFOA and PFOS.
- Other PFAS reported in one or more of the groundwater samples from the monitoring wells at the Longa Disposal Area include PFBA, PFPEA, PFHxA, PFHPA, and PFHxS

The presence of PFOA, PFOS, and other PFAS compounds in the groundwater samples collected from the Longa Disposal Area monitoring wells and the fact that a portion of the disposal area is within the SWPA for wells MVD-4/5 suggests the likelihood that the disposal area is a source of PFAS detected in the MVD wells.

2.3 Other Potential PFAS Sources

PFOA, PFOS, and PFAS compounds in general, have been used worldwide in the manufacture of many materials for industrial, commercial, and residential use, including stain-resistant carpeting and upholstery, carpet and upholstery cleaners, non-stick cookware, food package coatings, AFFFs, moisture-resistant breathable fabrics, concrete and rock sealants, electrical capacitors, dyes, paints, batteries, and as a vapor suppressor in metal plating processes. They are a ubiquitous presence in most households and, consequently, are found in municipal waste streams and in most landfills (Busch et al., 2009; MPCA, 2009). PFAS are also found in biosolids (e.g., Sepulvado et al, 2011) that are used as amendments to soil in agricultural and landscaping applications including gravel pit reclamation (NEBRA, 2014). They are also used as a sealant for granite, stone and tile (Guo et al., 2009; 3M, 1999) and potentially in the wet saw process associated with cutting granite and stone (NJDEP, 2015).

Due to their use worldwide for many industrial, commercial, and residential uses, there are many potential sources of PFAS impacts to groundwater in developed areas. Near wells MVD-4/5 and the Longa Disposal Area many current and historical property uses have been identified through review of readily available records as potential sources of PFAS to groundwater. These uses include, but are not limited to: car wash, auto detailing, upholstery cleaning, granite, stone and tile fabrication, and printing. Other sources will likely be identified as more information on PFAS usage becomes available.

2.4 Purpose of Work

The goal of the work presented in this report was to assess conditions near wells MVD-4/5. The purpose of this work was to fill data gaps regarding concentrations of PFAS in groundwater and groundwater flow directions near wells MVD-4/5. Wells MVD-4/5 are located approximately 800 feet (MVD-5) to 1,100 feet (MVD-4) north-northeast of the Longa Disposal Area (Figure 1).

2.5 Scope of Work

The investigation scope of work included the following:

- Aquifer profiling and groundwater sampling
- Collection of soil samples for grain size analysis
- Development and sampling of existing wells, including MVD-4, MVD-5, and MVD and Longa Disposal Area monitoring wells
- Surface water sampling
- Surface and groundwater level measurement
- Elevation surveying
- Groundwater flow modeling of the MVD-4/5 well field

This report includes a summary of the water-quality results, measured water levels in wells and the Merrimack River and Baboosic Brook, boring logs, well development records, and relevant hydrogeologic data including hydrogeologic cross sections showing geologic units and the distribution of PFAS in the subsurface, and groundwater impact distribution plan views. Interpretations of groundwater flow under pumping and non-pumping conditions are also presented. Groundwater flow modeling is presented in Appendix C.

3.0 Investigation Methods

3.1 Field Methods

A work plan for the investigation discussed in this report was submitted to the NHDES prior to the start of the investigation. The NHDES provided comments on the initial draft scope of work (NHDES, 2016). These comments were addressed in a final scope of work titled: Proposed Investigation Scope of Work: MVD Supply Wells 4 and 5, Merrimack, NH – REVISED (Barr Engineering Co., 2016b) that was submitted to NHDES on October 20, 2016.

Field data collection was completed during two mobilizations to the site between October 17, 2016 and January 25, 2017. The first mobilization occurred October 17, 2016 through November 15, 2016. The field data collection consisted of aquifer profiling (including groundwater sampling at profiling locations), groundwater sampling at MVD and monitoring wells, stream gaging and sampling, and surveying. The second mobilization occurred January 7, 2017 through January 28, 2017, during which soil samples and the remainder of the profiling location groundwater samples were collected.

3.1.1 Aquifer Profiling

Aquifer profiling using the Waterloo^{APS} characterization method was performed to provide information on hydrostratigraphy and to allow groundwater sampling at multiple discrete depths in a single borehole. This investigative method has been utilized in the evaluation of PFAS in other areas of the Northeast. For the purpose of PFAS studies, potential PFAS-containing components were eliminated from the Waterloo^{APS} system. Hydrologic information provided by the Waterloo^{APS} profiling method includes an approximate measure of hydraulic conductivity (the "index of hydraulic conductivity" which is symbolized as iK) that is estimated from the measured flow rate and pressure of water injected as the probe is advanced through the subsurface. This parameter is calculated in real-time, which enables selection of sampling intervals in relatively permeable zones. Additional background information on this method, including standard operating procedures developed by the aquifer profiling contractor, is provided in Appendix A. Ten aquifer profiling locations (AP01 through AP10) were completed near well MVD-4, along the property line between the Longa Disposal Area and wells MVD-4/5, and along a transect north of the MVD wells. Aquifer profiling locations are shown on Figure 4.

3.1.2 Water sampling

Groundwater samples were collected at aquifer profiling locations, wells MVD-4/5, the MVD monitoring wells, and the Longa Disposal Area monitoring wells. Surface water samples were collected at monitoring locations along Baboosic Brook and the Merrimack River. Samples were collected consistent with the Quality Assurance Project Plan (QAPP) and standard operating procedures (SOPs), with exceptions noted in Section 3.4 below.

3.1.2.1 Groundwater and surface water sampling

The Waterloo^{APS} system was used to collect groundwater samples from selected intervals (at approximately ten foot intervals) during the aquifer profiling work. The Waterloo^{APS} system allows for

sample collection through a 2-inch long sampling head with screened ports using peristaltic or gas-driven (bladder) pumps. At some profiling locations, screens in the aquifer profiling equipment became plugged with fine-grained sediments in some planned sampling intervals. Subsequently, samples were then collected at these intervals using the Geoprobe® Screen Point 16 groundwater sampling system during the second mobilization to the site. This system is described in the SOP included in Appendix A. The groundwater samples were sent to Eurofins Lancaster Laboratories Environmental (ELLE) in Lancaster, PA and analyzed for the parameters shown in Table 1. A summary of groundwater samples and collection method is shown in Table 2. Groundwater sampling logs are included in Appendix D. Analytical results are presented in Table 4; laboratory reports are included in Appendix E.

3.1.2.1.1 Wells MVD-4/5

Wells MVD-4 and MVD-5 were pumped and sampled on November 14, 2016. Prior to sampling, both wells were operated for 30 minutes, as discussed above in Section 2.1. The pumping rate for well MVD-4 ranged from 220 to 225 gallons per minute (gpm). The pumping rate for well MVD-5 was 382 gpm. Four samples of the discharge water were collected from the MVD wells at ten minute intervals (i.e., samples collected at 0 minutes, 10 minutes, 20 minutes and 30 minutes). Water generated from the pumping of wells MVD-4 and MVD-5 was collected in two frac tanks mobilized to the site by Clean Harbors. Upon completion of the tests and receipt of the associated analytical data, the water was transferred to tanker trucks and disposed by Clean Harbors at their disposal facility in South Portland, Maine. Waste disposal manifests can be found in Appendix D.

3.1.2.1.2 Monitoring wells

All monitoring wells within the MVD property (13 wells) and Longa Disposal Area (four wells) were sampled during the first mobilization to the site. Wells not sampled in the June 2016 sampling round (SHA, 2016) were developed prior to sample collection for the investigation discussed in this report. Samples were submitted to ELLE and analyzed for the parameters shown in Table 1. Monitoring well locations are shown on Figure 4 and a summary of monitoring well information is included in Table 3. Sampling and redevelopment logs are included in Appendix D. Analytical results are presented in Table 4.

3.1.2.2 River/stream water grab samples

Grab samples were collected at the river/stream gaging locations shown on Figure 4 on November 7-8, 2016. Samples were collected beginning at downstream sampling locations, and moving upstream.

Surface water samples were collected at three monitoring locations within Baboosic Brook (the downstream, midstream, and upstream sampling locations shown on Figure 4) and the Merrimack River (the downstream and upstream sampling locations shown on Figure 4), Samples were submitted to ELLE and analyzed for the parameters shown in Table 1. Surface water sampling/monitoring locations are shown on Figure 4. Sampling logs are included in Appendix D. Analytical results are presented in Table 4.

3.1.2.3 QA/QC sample collection

Field quality assurance/quality control (QA/QC) samples were collected in accordance with the QAPP and included equipment blanks, field duplicates, matrix spike/matrix spike duplicates (MS/MSD), field blanks,

and laboratory trip blanks. Additional equipment blanks were collected in excess of the QAPP-specified one set of QC samples per 20 media samples at select Waterloo^{APS} profiling locations during groundwater sampling. A summary of groundwater QA/QC samples is shown in Table 5.

3.1.3 Soil Sampling

Soil borings were advanced at four locations using direct-push (Geoprobe®) drilling methods for the purpose of soil classification, and sampling for chemical and physical analysis. Borings were terminated at or below the water table and soils were classified using the modified Burmister Soil Classification System. Boring logs are included in Appendix F. A summary of collected soil samples is presented in Table 2.

3.1.3.1 Samples for PFAS analysis

Unsaturated zone soil samples were collected at the four aquifer profiling locations (AP02, AP05, AP06, and AP09) shown on Figure 4. The samples were collected at nominal five-foot intervals between ground surface and the water table, as indicated by water-level measurements in the Geoprobe® setup. The samples were submitted to ELLE and analyzed for VOCs, PFASs, and total organic carbon (TOC). Analytical data is presented in Table 6.

3.1.3.2 Samples for grain-size analysis

Samples thought to be representative of a range of hydraulic conductivity values were collected and analyzed for grain-size distribution at ELLE. The grain size distributions are shown in Table 6. The sampling depths were selected after review of the iK data profiles generated by the Waterloo^{APS} method, with the objective of assessing consistency in variations between the iK data and hydraulic conductivity estimates from grain-size analyses. Hydraulic conductivity was estimated for each grain-size distribution using the method of Barr (2001). The hydraulic conductivity estimates are shown in Table 7.

3.1.3.3 QA/QC sample collection

QA/QC soil samples (field duplicate and MS/MSD samples) were collected in accordance with the QAPP at one QA/QC sample each per 20 samples. Analytical results for the QA/QC samples are presented in Table 5.

3.1.4 Water-level measurement

Synoptic rounds of water level measurements were performed on October 31, November 7, and November 23, 2016. Transducers were deployed in monitoring wells 45-10 and 45-8 In November 2016. Differences between calculated groundwater elevations at each well between events were used as a basis for identifying outliers in the data. Figures 5, 6, and 7 are contour maps of the groundwater elevation data. Groundwater elevations were estimated at the vertical aquifer profiling locations using the Waterloo^{APS} system. Groundwater elevations at profiling locations AP07 through AP10 were included with the groundwater elevations calculated for wells in the MVD well field and around the Longa Disposal Area.

3.1.5 Stream gaging

Two staff gages were installed on the Merrimack River (Figure 4) and used to measure river elevation during the second and third synoptic water level measurement rounds. The difference in calculated river stage between the two gages was 0.09 feet on November 7 and 0.07 feet on November 23, 2016. The calculated average slope on this reach of the river at that time is 1.6×10^{-5} ft/ft. The river stage information was assumed to represent the water table elevation at the river bank in preparing the groundwater elevation contour maps shown on Figures 5, 6, and 7.

3.1.6 Surveying

The elevations and locations of all monitoring wells and river stage measurement points were surveyed by registered surveyors from CT Male. Ground surface elevations at aquifer profiling and Geoprobe® locations were interpolated using LiDAR data obtained through the National Oceanic and Atmospheric Administration (NOAA). A summary of surveyed and interpolated ground surface elevations are shown in Tables 2 and 3.

3.2 Laboratory Analyses and Quality Assurance/Quality Control Review

A QA/QC review was conducted to assess the integrity of the field procedures and the validity of the analytical results for the October 2016 to January 2017 sampling period. The analytical data were evaluated according to the procedures outlined in the Barr Engineering Co. Standard Operating Procedures (SOPs), which are based in part on guidance from the National Function Guidelines as well as QA/QC protocols from approved analytical methods. The QA/QC review concluded that the data are acceptable as presented in the data tables. Details of the review are presented in Appendix B.

3.3 Groundwater Modeling Methods

A local-scale groundwater flow model was developed to simulate flow in the saturated groundwater flow system near wells MVD-4/5. The groundwater flow model was developed to assess hydraulic capture of wells MVD-4/5 from potential PFAS sources by quantifying the water balance for the pumping wells at various historical operational rates. The purpose of the model is to help understand how PFAS compounds may have reached the MVD wells by delineating from where in the unconsolidated aquifer the wells receive water under various pumping conditions. Details of the groundwater model construction are presented in Appendix C.

3.4 Deviations from Work Plan

The work performed for this investigation included several deviations from the Work Plan dated October 20, 2016. As discussed further below, these deviations resulted from difficulties in sample collection using the Waterloo^{APS} method, omission of soil parameters from the Work Plan, and inadvertent collection and analysis of soil samples for VOCs.

The fine sand encountered in the subsurface at some profiling locations led to clogging of the sampling port of the Waterloo^{APS} system. This clogging caused significant delays in sample collection during the

initial field mobilization. As a result, a request was made to collect samples using the Geoprobe® screen point method at the original aquifer profiling locations. This request was submitted to NHDES on January 3, 2017. In the same communication describing changes in groundwater sampling methods, additional soil parameters (total organic carbon, moisture content, and grain-size distribution) were proposed to be measured, having been omitted from the original (October 2016) Work Plan.

Sampling with the Geoprobe® screen point method required some samples to be collected after purging fewer than three riser volumes. A revised sampling approach was adopted in which samples were collected from the Geoprobe® screen point system upon stabilization of water quality parameters. These samples are identified in Table 2.

Soil samples collected across the unsaturated zone for PFAS analysis were also analyzed for VOCs, despite the VOC analysis not being proposed in the Work Plan. The results from these analyses are reported herein.

Two aspects of the Work Plan have not yet been completed, as they require input from NHDES. The permanent monitoring wells proposed to be installed along the AP07-AP10 profiling transect north of the MVD area have not been installed because NHDES has requested that they be included in the decision of where and at what depth the wells are installed. The elevation surveying of the profiling locations is planned to be completed upon installation of any permanent monitoring wells; estimated elevations have been used for this analysis.

4.0 Investigation Results and Discussion

4.1 Site Geology

As shown on Figure 8, the surficial unconsolidated deposits in the vicinity of wells MVD-4/5 and the Facility consists mainly of stream terrace deposits that cut into glacial lake and till deposits and recent alluvial deposits. The stream terraces are composed mainly of sand to gravel with minor amounts of silt. The Merrimack River is incised through terrace deposits and has narrow alluvial deposits on the west (right) bank through much of the reach between the Facility and the MVD well field (Figure 8). The alluvial deposits on the right (west) bank widen in the vicinity of the MVD-4/5 well field as compared to northern reaches including the area of the Facility.

Unconsolidated deposits encountered during the drilling portion of the investigation were classified using a modified version of the Burmister soil classification method at the request of the NHDES. The soils encountered during the investigation included mainly fine sand to gravel with lesser amounts of silt and clay. The iK values provided by the Waterloo^{APS} system range from approximately 0.01 to 5.46. The boring logs and profiling logs are presented in Appendices F and G, respectively.

A comparison of the Burmister soil classifications and the iK values was done for the limited number of depth intervals for which both data were available. There was generally good correlation between the Burmister soil classifications and the iK values for those depth intervals that had an iK less than approximately 1.0 or greater than approximately 3.0. iK values between approximately 1.0 and 3.0 appear to be largely affected by the fines content of the soil, as there is no strong correlation between the observed soils and measured iK for that range.

Data acquired during the investigation were used to create a three-dimensional model of geology using Earth Volumetric Studio^{TM} (EVS) software, developed by C Tech Development Corporation. The EVS model incorporates available site geology data, including geology observed at the MVD well field (EGGI, 2003) and Longa Disposal Area monitoring wells (HTA, 1989).

The indicator kriging method was used to interpolate the geology. Indicator kriging is a geostatistical method for estimating discrete values (e.g., geology type) within a three-dimensional grid; therefore interpolated values are more certain in areas with more data. The indicator geology model is bounded vertically by the ground surface (top) and the top of bedrock (bottom), and bounded horizontally by the extent of site data.

The site unconsolidated lithology was categorized into fourteen lithological/soil types based on the Modified Burmister Soil Classification System. Bedrock was not included in the geologic model and top of bedrock was modeled as a surface, which bounds the bottom of the geologic model. Each unconsolidated interval of a boring log was assigned to one of the lithological/soil types. In this way, the top and bottom elevation of each interval in a boring log, combined with the geographic coordinates of the boring, provided the input data that were interpolated in three dimensions using EVS.

The geologic model was used to develop five cross sections through the investigation area. Cross section locations are shown on Figure 9. The 14 unconsolidated lithological/soil types were simplified for presentation. The cross sections are shown on Figures 10 through 12. As shown on the cross sections, the alluvium in the vicinity of wells MVD-4/5 and the Longa Disposal Area consists mainly of fine sand to gravel with minor silt and/or clay interbeds.

4.2 Hydrogeologic Setting

Merrimack, New Hampshire is located in the Northeastern Appalachians groundwater region (Randall et al., 1988), and the following summary is condensed from that resource unless otherwise indicated. This region is characterized by rolling topography that primarily reflects the weathered bedrock surface with glacial and fluvial landforms mantling the bedrock. The bedrock consists of folded and faulted metamorphosed sedimentary rocks with low primary porosity. Water is conducted in the bedrock through secondary porosity. Recharge from infiltrating precipitation is generally the most important source of water and discharge to surface water is typically the most important groundwater sink. Pumping of high capacity wells is also a groundwater sink. Characterizing recharge and discharge is the key to understanding groundwater flow directions.

Glacial erosion and deposition produced changes in drainage and topography and deposited a nearly continuous layer of unconsolidated till over the bedrock. Stratified drift units, chiefly sand and gravel, follow the larger valleys such as that of the Merrimack River. These stratified drift units are referred to as valley-fill aquifers (Kontis, et al, 2004).

Recharge to the bedrock is controlled by the permeability and thickness of the overlying glacial deposits and overburden. Runoff in upland areas is focused to seasonal streams that typically lose discharge in areas in which they flow over stratified drift at the margins of the larger valleys. Recharge to bedrock wells that are pumped continuously may occur from adjacent stratified drift aquifers. Discharge is primarily from the bedrock to wells and to the stratified drift in the large valleys. Inter-basin flow systems with significant discharge have not been discovered in the bedrock.

In addition to discharge to the stratified drift filling the larger valleys from minor upland streams (Kontis et al., 2004), recharge to these units is from direct infiltration of precipitation, and discharge from bedrock. Recharge from the larger rivers may take place in the case of localized pumping from the stratified drift. Under normal conditions, the main stream in the major valleys consistently gains water from stratified drift aquifers (Kontis, et al, 2004). The Merrimack River acts as a source of groundwater in the aquifer adjacent to the river during periods of rising river stage (a process known as bank storage; Kontis, et al, 2004) and a sink for groundwater during periods of falling and sustained low river stage. Discharge from the stratified drift is via pumping wells, evapotranspiration, and to the larger rivers when their stage is at or below typical levels.

4.2.1 MVD/Longa Area Groundwater-Surface Water Interactions

Aquifer testing performed in 2003 using wells MVD-4/5 (EGGI, 2003) indicated the alluvial materials along the Merrimack River have a strong hydraulic connection with the river. Two temporary piezometers were

installed in the river bank and a river stage monitoring gage was also installed (EGGI, 2003) for the aquifer testing. Hydrographs from the piezometer closest to the river gage and the river show quite similar elevations and variations in elevation during the testing period (EGGI, 2003; see also Appendix C). No measureable drawdown occurred in the temporary piezometers during the aquifer test. Monitoring well 45-5a was the permanent monitoring well closest to the River that was monitored during the testing. Hydrographs for the permanent monitoring wells show that well 45-5a was the only permanent monitoring well in which influence from the river was noted during the aquifer testing period (EGGI, 2003; see also Appendix C).

The relatively high contribution of groundwater to the flow in rivers and streams in the investigation area is supported by an assessment of baseflow. Baseflow is the component of streamflow that is sustained by groundwater discharge to the stream, and the baseflow index (BFI) for a streamflow measurement location is the proportion of total streamflow that is baseflow. A BFI of approximately 0.69 was estimated for the Merrimack River in Lowell, MA (USGS Gage 01100000) (CDM, 2004). This value indicates that approximately 70 percent of the total streamflow measured at the gaging station originates as baseflow.

Some component of down-valley groundwater flow likely takes place in the stratified drift beneath the Merrimack River and in places where a floodplain has developed adjacent to the river. Down-valley groundwater flow is present in areas where the hydraulic gradient parallels and roughly equals the down-valley slope of the floodplain and is referred to as "underflow" (Kontis, et al, 2004). The Merrimack River is incised through terrace deposits and has narrow alluvial deposits on the west (right) bank through much of the reach between the Facility and wells MVD-4/5 (Figure 9). The alluvial deposits on the right bank widen in the vicinity of the MVD well field.

The USGS water table map of the area (Toppin, 1987) indicates no significant zone of down-valley groundwater flow at any appreciable distance from the Merrimack River (Figure 13). Groundwater flow toward the Merrimack River in the vicinity was also shown for a site located at 33 Elm Street (Aries, 1990), which is approximately 1,000 feet northeast of profiling location AP09. Pumping of wells MVD-4/5 created a cone of depression that extended to the river and created radial flow toward the wells and induced some amount of recharge from the river to the valley-fill aquifer near the well field (EGGI, 2003) during the test. Medalie and Moore (1995) refer to this process as induced infiltration. Overall, underflow is likely not a significant factor in the river reach between the Facility and wells MVD-4/5 due primarily to the limited extent of alluvial deposits in that reach.

4.2.2 MVD/Longa Disposal Area Interaction with Bedrock

EGGI (2003) considered contributions from the underlying bedrock aquifer to be negligible; however, their report states that they did not evaluate those contributions in their investigation. Flow of groundwater from the bedrock, through the unconsolidated materials, and discharging to the regional discharge zone (the Merrimack River) is an integral component of the regional conceptual hydrogeologic model (e.g., Randall et al., 1988; Kontis et al., 2004). Available information does not indicate that groundwater flow from the bedrock into the unconsolidated materials should be considered negligible, therefore

groundwater flow from the bedrock to the unconsolidated materials was simulated in the MVD-4/5 groundwater model (Appendix C).

4.3 Groundwater Flow and Capture from the Longa Disposal Area

As discussed above, EGGI (2003) showed that pumping of wells MVD-4/5 created a cone of depression that extended to the river and created roughly radial flow toward the wells during their pumping test. In addition, the SWPA delineated for wells MVD-4/5 indicates that the wells can capture some groundwater from beneath the Longa Disposal Area. The groundwater flow direction in the MVD-4/5 well field/Longa Disposal Area indicated by the water table contours on Figures 5, 6, and 7 shows that, when wells MVD-4/5 are not pumping, groundwater flow in the area is toward the Merrimack River. This non-pumping condition flow pattern is consistent with the groundwater flow indicated by Figure 13 and with that described by Aries (1990). The data collected in this study indicate that under non-pumping conditions groundwater does not flow from the Longa Disposal Area to wells MVD-4 and MVD-5.

The groundwater flow model (described in detail in Appendix C) was used to evaluate groundwater flow to wells MVD-4 and MVD-5 under several different conditions. Simulation of summer pumping conditions (i.e., high demand) was used to evaluate the fraction of water pumped by wells MVD-4/5 that passes beneath the Longa Disposal Area. Summer pumping conditions would be expected to produce an area of capture with the greatest extent within the model domain. The modeled capture area for wells MVD-4/5 within the model domain under summer (i.e., high demand) conditions is shown on Figure 14. The modeled capture area does extend beneath the Longa Disposal Area.

The groundwater model was also used to predict the fraction of water pumped from wells MVD-4/5 that flows beneath the Longa Disposal Area. When making predictions with a groundwater model it is important to account for uncertainty in the model results. Therefore, a predictive uncertainty analysis was performed as part of the assessment of the fraction of pumpage from wells MVD-4/5 passing beneath the Longa Disposal Area. The predictive uncertainty evaluation determined with a 95 percent confidence interval that the percentage of water that wells MVD-4/5 pump which passes beneath the Longa Disposal Area ranges from less than 1.6 percent to approximately 15 percent.

Simulations of conditions from 1989 to 2016, using the calibrated groundwater model parameters, indicate that the long term fraction of pumpage from wells MVD-4/5 passing beneath the Longa Disposal Area ranges from 0 to approximately 3 percent, depending primarily on the pumping rate of wells MVD-4/5 (Figure 15; Appendix C).

4.4 PFAS Concentrations

The results of the NHDES sampling of water wells in the area are shown on Figures 2 and 3. The NHDES sampling included both wells pumping from the unconsolidated materials above bedrock and wells pumping from the bedrock. As shown on Figures 2 and 3, sample locations where the reported PFOA and PFOA+PFOS concentrations are greater than the 70 ppt NHAGQS limit tend to be clustered to the east of the Merrimack River and within the area around the Facility in which annual average air deposition rate of PFOA has been preliminarily modeled to be approximately 200 $gm/m^2/year*10^{-6}$ or higher (Barr

Engineering Co., 2017). There are, however, some locations beyond the preliminarily modeled annual average air deposition area for which PFOA and PFOA+PFOS concentrations exceeded 70 ppt. Wells MVD-4/5 and the Longa Disposal Area are in the area where the preliminarily modeled annual average air deposition rate is less than 100 gm/m^2/year*10^{-6} (Barr Engineering Co., 2017). This suggests that there may be multiple sources contributing to the observed distribution of PFAS in groundwater in this area.

4.4.1 Soil

A total of 12 unsaturated soil samples were collected at four boring locations (Table 10). Soil samples were collected at varying depths throughout the soil column, spanning from 2 feet below ground surface (bgs) to 21.5 feet bgs. Figures 16 and 17 show the vertical distribution of the soil samples collected along profiling transects AP01-AP06 and AP07-AP10, respectively, along with concentrations of PFOA and total sulfur-containing PFAS compounds reported in the samples.

As shown on Table 6, eight of the 12 unsaturated soil samples did not have a reported detection of PFOA. Of the remaining four unsaturated soil samples, three of the reported detections of PFOA were estimated values below the reporting limit. Eleven of the 12 unsaturated soil samples had no reported detection of PFOS and 10 of the 12 samples had no reported detection of any other PFAS compound (Table 6). Table 6 also shows that six of the 12 unsaturated soil samples did not have a reported detection of total organic carbon. Due to the large number of non-detect results, it was not possible to determine any correlation between PFAS and TOC.

4.4.2 Groundwater

4.4.2.1 Wells MVD-4/5 and Longa Disposal Area Vicinity

Analytical results for groundwater samples collected during the field investigation were combined with data from the NHDES sampling program to evaluate the distribution of PFAS in the groundwater in the area near wells MVD-4/5 and the Longa Disposal Area. Figures 18, 19, and 20 show the areal distribution of PFOA, PFOS, and PFOA+PFOS, respectively, in the groundwater in the vicinity of wells MVD-4/5 and the Longa Disposal Area based on the available sampling results. Also shown on these figures is the modeled capture area within the model domain for wells MVD-4/5 under summer pumping conditions discussed above in Section 4.3 and in Appendix C.

Figure 18 shows that the PFOA concentrations greater than 70 ppt have been detected in groundwater to the north and north-northeast of wells MVD-4/5. In addition, PFOA concentrations greater than 70 ppt have been reported in samples collected from near the southern portion of the Longa Disposal Area. By contrast, Figure 19 shows that PFOS was reported at concentrations greater than 10 ppt at only a few sampling locations in the vicinity of wells MVD-4/5 area. As shown on Figures 18 and 20, areas in which reported PFOA and PFOA+PFOS concentrations exceed 70 ppt are overlapped by the modeled high demand pumping capture area for wells MVD-4 and MVD-5. The distribution of PFOA+PFOS relative to the modeled capture area for wells MVD-4/5 suggests that it is possible that some PFOA and PFOS could have migrated to wells MVD-4/5 after passing beneath the Longa Disposal Area when they were pumping to meet high demand. However, the groundwater modeling predicts that only a small fraction of the water pumped by wells MVD-4/5 is likely to have passed beneath the Longa Disposal Area. The areal

distribution of PFOA+PFOS relative to the model-predicted capture area for wells MVD-4/5 suggests it is more likely that the main source for PFAS in wells MVD-4/5 is from areas to the west and northwest of the wells.

Profiling results along transects AP01-AP06 and AP07-AP10 are shown on Figures 16 and 17, respectively. Inspection of these figures indicates that, in general the highest groundwater concentrations of PFOA and sulfur-containing PFAS are found in the deeper portions of the borings. The exceptions to this are borings AP08 and AP09. At boring AP08 the highest concentration of PFOA+PFOS (285 ppt) was identified in the sample collected just below the water table. Concentrations in subsequent sampling intervals then decreased until the lowermost 25 feet of the boring where the concentrations increased with depth. In boring AP09 the PFOA+PFOS concentrations are greater than 100 ppt in all groundwater samples collected from the boring. The borings were advanced to refusal, which was interpreted to be at or very near the bedrock surface. Note that no PFAS were reported in the soil samples collected from above the water table in boring AP09 (Figure 17, Table 6). The observed PFAS distribution does not appear to be consistent with an on-going infiltration of high-concentrations of PFAS in the vicinity of these transects. The distribution does appear to be consistent with upgradient groundwater flowing into the regional discharge zone at the Merrimack River and bringing with it PFOA and other PFAS compounds.

Very low concentrations (i.e., near or below the reporting limit) of some trihalomethanes were reported in some of the groundwater samples collected from borings AP02 and AP04 and the sample from Longa Disposal Area monitoring well MW-3 (Table 4). Residual concentrations of trihalomethanes can be formed as disinfection byproducts in potable water systems. The source of the trihalomethanes in the samples is not known.

Volatile organic compounds were analyzed for in the groundwater samples collected from monitoring wells and profile borings. No volatile organic compounds were detected, except for one or a few compounds at concentrations near or below the reporting limits in two of the Longa Disposal Area monitoring wells, one monitoring well upgradient of wells MVD-4/5, and four (out of 74) of the profiling samples (Table 4).

Figure 10 shows a north to south cross section view of the PFOA+PFOS concentrations looking from the west toward the Merrimack River. The cross section extends from profiling location AP09 in the north to monitoring well MW-4 on the south end of the Longa Disposal Area. There does not appear to be a close correlation between the variations in the stratigraphy and the vertical distribution of PFAS. The cross section shows that PFOA+PFOS concentrations less than 70 ppt are present in the unconsolidated materials between wells MVD-4/5 and the Longa Disposal Area. Figures 11 and 12 show general west to east cross sections in the vicinity of wells MVD-4/5 and the Longa Disposal Area with the vertical distribution of PFOA+PFOS. As shown on Figure 14, concentrations of PFOA+PFOS greater than 70 ppt were reported for NHDES sampling locations near the modeled high demand pumping capture area for wells MVD-4/5. The presence of PFOA+PFOS in the vicinity of wells MVD-4/5 and the Longa Disposal Area is consistent with transport of these compounds from upgradient areas (west and northwest) toward the Merrimack River (east).

Wells MVD-4/5

The analytical results for the samples collected during the pumping of MVD-4 and MVD-5 are shown in Table 4. Field measurements of pH, temperature, oxidation/reduction potential (ORP), dissolved oxygen, turbidity, and specific conductance were made at the times the analytical samples were collected. These field measurements are summarized in Tables 8 and 9.

The concentrations of the major anions and cations in the samples collected from wells MVD-4/5 during the tests are shown on Figures 21 and 22. A comparison of the chloride and nitrate results in Figures 21 and 22 with historical data presented by EGGI (2003) indicates that the concentrations in the samples collected during the 2016 testing are consistent with the historical ranges of these constituents.

Wells MVD-4/5 had been offline for approximately six months prior to the sampling of these wells during the field investigation. There are not significant differences between the anion and cation concentrations in the samples from wells MVD-4/5 and the samples from the Longa Disposal Area monitoring wells. As such, the anion and cation data is inconclusive relative to showing whether water pumped from wells MVD-4/5 passed beneath the Longa Disposal Area.

Water samples collected from both MVD-4 and MVD-5 during the 30-minute pumping of the wells in November 2016 contained PFAS at detectable concentrations. Table 4 and Figures 23 and 24 show that the predominant PFAS species measured was PFOA. All the samples collected from wells MVD-4/5 had PFOA concentrations below the NHAGQS limit of 70 ppt. The sample collected from MVD-4 at t = 20 minutes had a PFOA+PFOS concentration equal to the NHAGQS limit of 70 ppt (Table 4). The PFOA+PFOS concentrations reported for the remainder of the samples from wells MVD-4/5 were less than 70 ppt. The concentrations of the PFAS-related constituents measured over the course of the 30 minute test at MVD-4 and MVD-5 are shown on Figures 23 and 24, respectively. For comparison, these wells were last sampled by the State of New Hampshire on July 7, 2016, and in that event, MVD-4 had 84 ppt PFOA and no detection of PFOS and MVD-5 had 48 ppt of PFOA and no detection of PFOS (NHDES, 2017). Volatile organic compounds were analyzed for in wells MVD-4/5. No volatile organic compounds were detected.

4.4.3 Surface Water

Surface water samples were collected from three locations on Baboosic Brook and two locations on the Merrimack River (Figure 4) in November 2016. Table 4 shows that PFOA+PFOS was detected in the surface waters but at concentrations below 20 ppt. Table 4 also shows that the individual concentrations of PFOA and PFOS in these samples were estimated values or reported as non-detect. As discussed in Appendix C, the Merrimack River does not appear to be a major source of water to wells MVD-4/5 when they are pumping. Coupled with the low concentrations of PFAS in the samples from the Merrimack River this would indicate that the River was likely not a significant source for PFAS reported in samples from the MVD system when the wells were pumping.

4.5 Overview of Findings

PFAS have been detected in groundwater samples collected by the NHDES in the area. The NHDES sampled wells in both unconsolidated sediments and bedrock. The concentrations of PFOA+PFOS in

many of the samples exceed the NHAGQS level of 70 ppt. Generally higher concentrations in the samples collected by the NHDES tend to be clustered to the east of the Merrimack River and within the area around the Facility in which annual average air deposition rate of PFOA has been preliminarily modeled to be approximately 200 $gm/m^2/year*10^{-6}$ or higher (Barr Engineering Co., 2017). NHDES sampling results do show PFOA+PFOS concentrations greater than 70 ppt in areas where preliminary modeling indicates lower air deposition rates. This suggests the potential presence of other sources for PFAS in the area.

Wells MVD-4/5 and the Longa Disposal Area sit atop stream terrace deposits elevated approximately 25 feet above the Merrimack River floodplain. Groundwater flowing beneath the Facility is expected to flow to the unnamed drainage south of the Facility and to the Merrimack River. Multiple lines of data indicate that down-valley flow in the unconsolidated aquifer system is not a viable pathway from the Facility to wells MVD-4/5. Available information indicates that the area-wide groundwater flow pattern is toward the Merrimack River, which is the regional groundwater discharge zone. Groundwater flow patterns through the bedrock are controlled by the same natural hydrologic features as the unconsolidated deposits and wells MVD-4/5 do not penetrate bedrock; therefore, flow from the Facility through the bedrock to wells MVD-4/5 is not considered a viable or plausible pathway.

Groundwater modeling simulations and predictive uncertainty evaluation indicates that under high demand pumping conditions that no more than approximately 15 percent of the water pumped by wells MVD-4/5 would pass beneath the Longa Disposal Area. In addition, simulation of conditions from 1989 to 2016 indicates that the long-term fraction of pumpage from wells MVD-4/5 passing beneath the Longa Disposal Area would range over time from 0 to approximately 3 percent. The groundwater flow model was not constructed to recreate the SWPA delineated for wells MVD-4 and MVD-5 that encompasses the northern portion of the Longa Disposal Area (EGGI, 2003) but it is generally consistent with the previous work.

Groundwater sampling in the MVD-4/5 and Longa area indicates that PFAS are present in the groundwater in the area. This sampling included vertical profiling at multiple locations. The highest concentrations identified were in samples collected from profile borings located north-northeast of well MVD-4. The vertical distribution of PFAS in the profile borings generally do not appear to be consistent with a continuing source at or above the water table in the vicinity of the profiling locations.

The simulation of high demand pumping conditions for wells MVD-4/5 indicates that the capture area for the wells extends mainly to the west and northwest of wells MVD-4/5. This is consistent with available information on the regional groundwater flow direction in the area. The results of NHDES sampling of wells in the area shows that wells with PFOA+PFOS concentrations greater than 70 ppt are present in the area to the northwest of wells MVD-4/5. As such, groundwater flow from the area to the northwest of the wells would appear to be a source for PFAS detected in wells MVD-4/5, along with areas to the west. The modeling indicates that there is a component of groundwater flow that passes underneath Baboosic Brook from the west and PFAS could migrate from source areas west of Baboosic Brook to the MVD wells.

5.0 Summary and Conclusions

A groundwater investigation of the area around the Merrimack Valley District (MVD) wells 4 and 5 was conducted to characterize the presence of PFAS compounds in these wells and to better understand where the wells receive groundwater under various historical pumping conditions.

Detailed soil profiling and sampling, sampling of existing wells, and groundwater flow modeling to match historical pumping conditions were completed as part of the investigation. This investigation found:

- PFOA flowed to wells MVD-4/5 via groundwater from areas west and northwest of the MVD wells. Under non-pumping conditions, the groundwater flow paths from areas to the northwest would likely not have intersected the MVD wells. However, pumping of MVD wells 4/5 over time would have changed the groundwater flow directions and "pulled to the southeast" groundwater from this area.
- The Longa Disposal Area is not ruled out as a contributor of PFAS but it is likely not a significant contributor to wells MVD-4/5. Groundwater modeling indicates that the total flow of groundwater from underneath the Longa Disposal Area is up to approximately 15 percent of the total volume of water pumped by wells MVD-4/5 under summertime (high demand) rates. At lower pumping rates and under non-pumping conditions, groundwater passing underneath the landfill is not predicted to flow to the MVD wells. Volatile organic compounds (compounds that are typically associated with mixed-waste landfills) were found in the landfill's monitoring wells during previous investigations and a few volatile organic compounds were reported at concentrations near or below the reporting limits in two of the Longa Disposal Area monitoring wells sampled for this investigation. Volatile organic compounds were not detected in groundwater samples in monitoring wells or soil probes in the vicinity of wells MVD-4/5, except for a few instances of detections at or below the reporting limit, nor were they detected in multiple samples collected from MVD-4/5 under pumping and non-pumping conditions.
- The water level data, along with the groundwater modeling results and regional studies, indicate that there is not a groundwater migration pathway parallel to the Merrimack River north of the MVD-4/5 well field area. Direct migration of PFOA from the SGPP facility to the MVD wells is highly unlikely and not supported by the data.
- The fraction of Merrimack River water pumped from wells MVD-4/5 is estimated to range from 0 under long-term average pumping conditions to 12 percent under summer pumping conditions with normal recharge rates and river stages. The majority of the water pumped by wells MVD-4/5 originates from the west and northwest. The bedrock contributes some water to the wells as it discharges into the alluvial aquifer from the west. Baboosic Brook is also a contributor to flow to the wells and there is a component of flow that reaches the wells from areas west of Baboosic Brook.
- PFOA and other PFAS compounds were not detected in most of the unsaturated soils that were sampled in the vicinity of MVD wells 4 and 5 as part of this investigation and the few PFAS

compounds that were detected were at very low concentrations. These results suggests that there is not an aerially deposited source of PFAS in the vicinity of wells MVD-4 and MVD-5.

- There are many current and historical property uses near wells MVD-4/5 and the Longa Disposal Area that have been identified through review of readily available records as potential sources of PFAS to groundwater. These uses include, but are not limited to: car wash, auto detailing, upholstery cleaning, granite, stone and tile fabrication, and printing. Other sources will likely be identified as more information on PFAS usage becomes available. PFAS from such sources in upgradient portions of the capture area for wells MVD-4/5, including areas to the west of Baboosic Brook, could migrate from the source areas to wells MVD-4/5 wells and may be contributing to the overall concentrations and detections of the various PFAS in wells MVD-4/5.

[1] Ground surface and reference elevations surveyed by CT MALE.

[2] Ground surface elevation interpolated using available data obtained from the National Oceanic and Atmospheric Administration (NOAA).

[3] Water level tape stopped at 48.48 feet bgs. Potential blockage at this depth, as well as at 31.95 feet bgs.

UTM19N Universal Transverse Mercator Zone 19 North
NAVD88 North American Vertical Datum of 1988
ft feet
bgs below ground surface
NM not measured
ND no data available

Data Footnotes and Qualifiers

Barr Standard Footnotes and Qualifiers

--	Not analyzed/Not available.
N	Sample Type: Normal
FD	Sample Type: Field Duplicate
ND	Not detected.
TIC	Tentatively identified compound.
*	Estimated value, QA/QC criteria not met.
a	Estimated value, calculated using some or all values that are estimates.
b	Potential false positive value based on blank data validation procedures. Concentrations identified as potential false positive are excluded from calculations.
j	Estimated detected value. The reported value is less than the stated laboratory quantitation limit but greater than the laboratory method detection limit.

Data Footnotes and Qualifiers

Barr Standard Footnotes and Qualifiers

--	Not analyzed/Not available.
TIC	Tentatively identified compound.
*	Estimated value, QA/QC criteria not met.
b	Potential false positive value based on blank data validation procedures. Concentrations identified as potential false positive are excluded from calculations.
j	Estimated detected value. The reported value is less than the stated laboratory quantitation limit but greater than the laboratory method detection limit.

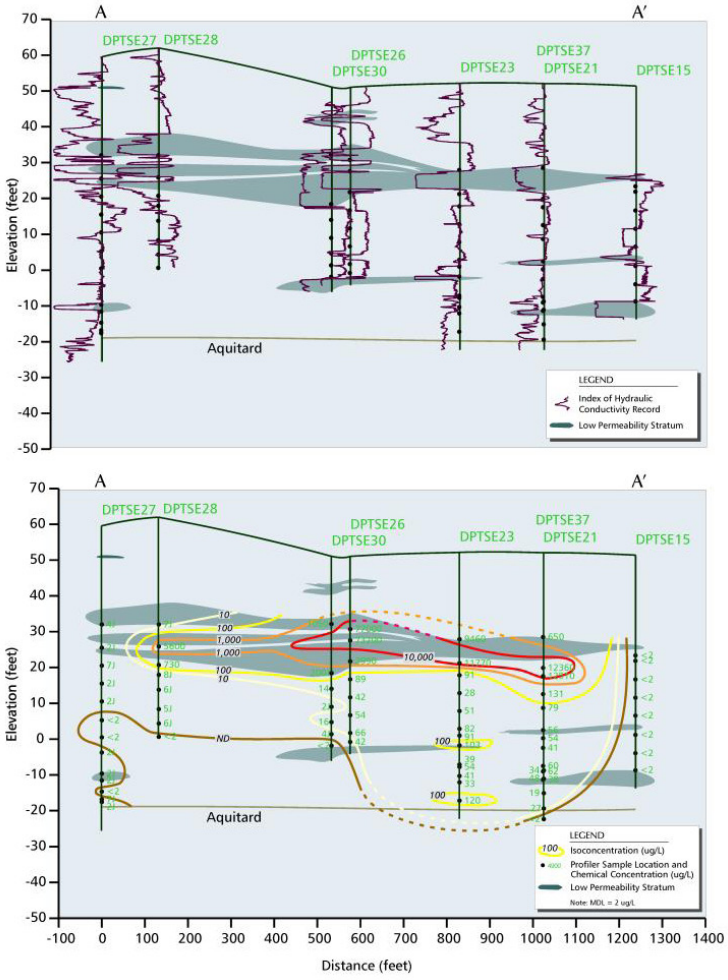
Waterloo APS TM

Vertical Aquifer Profiling with the Waterloo Advanced Profiling System

The Waterloo Advanced Profiling System (Waterloo$^{APS\ TM}$) is the next generation of the Waterloo Profiler that was originally introduced to investigation and remediation professionals in 1994.

Developed and tested extensively at the University of Waterloo, the Waterloo Profiler transferred High-Resolution Site Characterization (HRSC) capability from the groundwater research community to industry.

Built around this tool, Waterloo$^{APS\ TM}$ is a complete subsurface data collection platform, combining the same high-quality, discrete sampling capability with continuous, real-time hydrosratigraphic logging. This system has been utilized worldwide for the past 14 years in a broad array of environments. Using hybrid drive methods, the Waterloo$^{APS\ TM}$ has achieved depths of 600 feet below ground surface.



Real time hydrostratigraphic profiling in the same push with discrete depth sampling, without withdrawing the tool between samples, allows for very efficient high-resolution groundwater contamination investigation. In this figure the I_K allowed the investigator to identify and sample sand lenses with in a clay unit that serve as major contaminant transport pathways.

Waterloo APS™
ADVANCED PROFILING SYSTEM

CASCADE
DRILLING | TECHNICAL SERVICES

WATERLOO APS TM

Real-Time Hydrostratigraphic Logging and Sampling in a Single Push

The KPRO (hydraulic conductivity profiling) system incorporated into the Waterloo APS TM is the original injection logging hydraulic profiling tool. As the tool is advanced, clean water is injected into the formation while depth, pressure, and flow rate are monitored. From these data, a real-time continuous log of the Index of Hydraulic Conductivity is calculated. It is not necessary to drive the tool once to log the hydrostratigraphy and again to sample—both are accomplished in a single push.

Saving Time and Money

The KPRO hydrosratigraphic profiling system integrated into the Waterloo APS TM saves time and money in three important ways:

- KPRO helps us select depths at which to collect samples based on changes in stratigraphy as opposed to random or predetermined "blind" intervals. The I_K and sample collection are accomplished in a single push to obtain data more quickly and cost effectively.
- It enables a better understanding of the site's hydrostratigraphy for the creation of more accurate conceptual site models and flow and transport models.
- It identifies impermeable zones so time is not wasted trying to collect water samples in suboptimal locations. Low permeability zones can, and should, be sampled using high-resolution soil sampling techniques.

Multiple Models for Various Hydrogeologic Conditions

Waterloo APS TM 225—a 2.25-inch OD version is the most robust model, built to be used with the Geoprobe 8040 rigs for maximal depth penetration. The tip has more open area for higher sampling rates and reduced clogging. The 225 can be used with either a peristaltic pump or with the downhole nitrogen drive positive displacement pump.

Waterloo APS TM 175—the 1.75-inch OD version is the same diameter as the original Waterloo Profiler but utilizes more durable direct push rod and has the unique APS tip design.

One of these three profiling tip models is right for most conditions.

The KPRO system provides an integrated, high quality, high-resolution data collection system.

425-527-9700 | communications@cascade-env.com | www.cascade-env.com

STANDARD OPERATING PROCEDURE

SEI-6.43.5

GROUNDWATER PROFILING AND KPRO TESTING

SOP Number: SEI-6.43.5 Date Issued: 08/13/02
Revision Number: 5 Date of Revision: 01/06/2015

1.0 OBJECTIVE

Groundwater profiling is conducted to assess the distribution of contaminants and hydrogeologic conditions of a given aquifer at a scale much smaller (several centimeters) than the conventional monitoring well system. This method uses the Waterloo^{APS} (Advanced Profiling System) to collect groundwater samples at multiple discrete depths as the profiler is advanced vertically through unconsolidated, saturated porous media at a given location. The Waterloo^{APS} is a direct push tool used to collect samples and other data at multiple depths within a single hole without withdrawing and decontaminating the tool between samples. The profiling system can generate the following data in addition to the collection of groundwater samples for analysis:

1) Index of hydraulic conductivity (I_k)
2) Depth to potentiometric surface (water table)
3) Specific conductance
4) pH
5) Dissolved oxygen
6) Oxidation/reduction potential
7) Temperature

The index of hydraulic conductivity provides a real-time indication of the relative changes in hydraulic conductivity which allows for decisions to be made on depths to stop driving the profiler and collect samples as well as to assess the hydro-stratigraphy across the site.

There are two types of profiler configurations: 1) a peristaltic pump configuration with a single downhole tube and 2) a gas drive pump configuration with three downhole tubes.

The peristaltic pump can be used when the depth to water is less than the suction limit (typically around 25 feet below ground surface). The gas drive pump system must be used when the depth to water is greater than 25 feet below ground surface (bgs).

2.0 POLICIES

An experienced, qualified SEI staff member will train all SEI staff using this SOP.

SEI staff will read the most current version of this SOP and other appropriate SOPs prior to starting fieldwork.

3.0 SAFETY ISSUES

The corporate Health and Safety Plan and the Site Health and Safety Plan specify the procedures to be followed and equipment to be used during site activities. The following is a brief and general overview of safety issues.

- Potential Safety Issues include:
    - Noise Levels
    - Heavy equipment (drill rigs or direct push rigs) hazards
    - Overhead utility hazards
    - Underground utility hazards
    - Traffic/ motor vehicle hazards
    - Hazards associated with exposure to various chemicals
    - Slip, trip and fall hazards
    - Pinch point hazards
    - Compressed gas hazards
    - Fire hazards from hot work (e.g., grinding)
    - Gasoline hazards (filling generator)
- SEI staff and others under contract with SEI that may be present on-site will wear a hardhat whenever overhead hazards are present.
- Appropriate eye protection should be worn
- Hearing protection shall be worn whenever the drill rig is actively advancing profiling equipment.
- Steel toed boots will be worn.
- SEI staff will read the site health and safety plan (HASP) prior to beginning a project.
- Additional personal protective equipment shall be worn in accordance to the health and safety document.

4.0 PROCEDURE

4.1 Equipment

An equipment list is presented in Attachment 1. This list includes the equipment used for the peristaltic pump configuration and the gas drive pump configuration.

4.1.1 Drive Platform and Related Equipment

Any device that vibrates, hammers, or pushes drill tools can be used to advance the profiler. The type of drive platform selected is a function of the type of material to be sampled and the depth to which the profiler needs to be advanced. Typical drive platforms include GeoProbe 66 series probe rigs or similar rigs as well as larger conventional auger drill rigs with a breaker hammer mounted on the rig. A Geoprobe 8 series or equivalent is recommended to drive the 2.25" tip and rods. Field staff must ensure that the proper adaptors and subassemblies are provided for the particular drive platform to be used prior to taking to the field.

4.1.2 The Waterloo Profiler

This system is comprised of a 1.5, 1.75 or 2.25 -inch diameter profiling tip that is attached to 1.5 or 2.25-inch GeoProbe style rod or a quick thread style 1.75-inch diameter drill rod. The 1.5 and 2.25-inch drill rod is provided by others. The 1.75 inch rod is the standard rod size that Stone uses for profiling.

1.5, 1.75 and 2.25" Profiling Tips

The 1.5 and 1.75-inch profiling tips contain 4 removable plates, each with 4 screened sampling ports (16 total) that allow for the groundwater to pass into the tip. The 2.25-inch

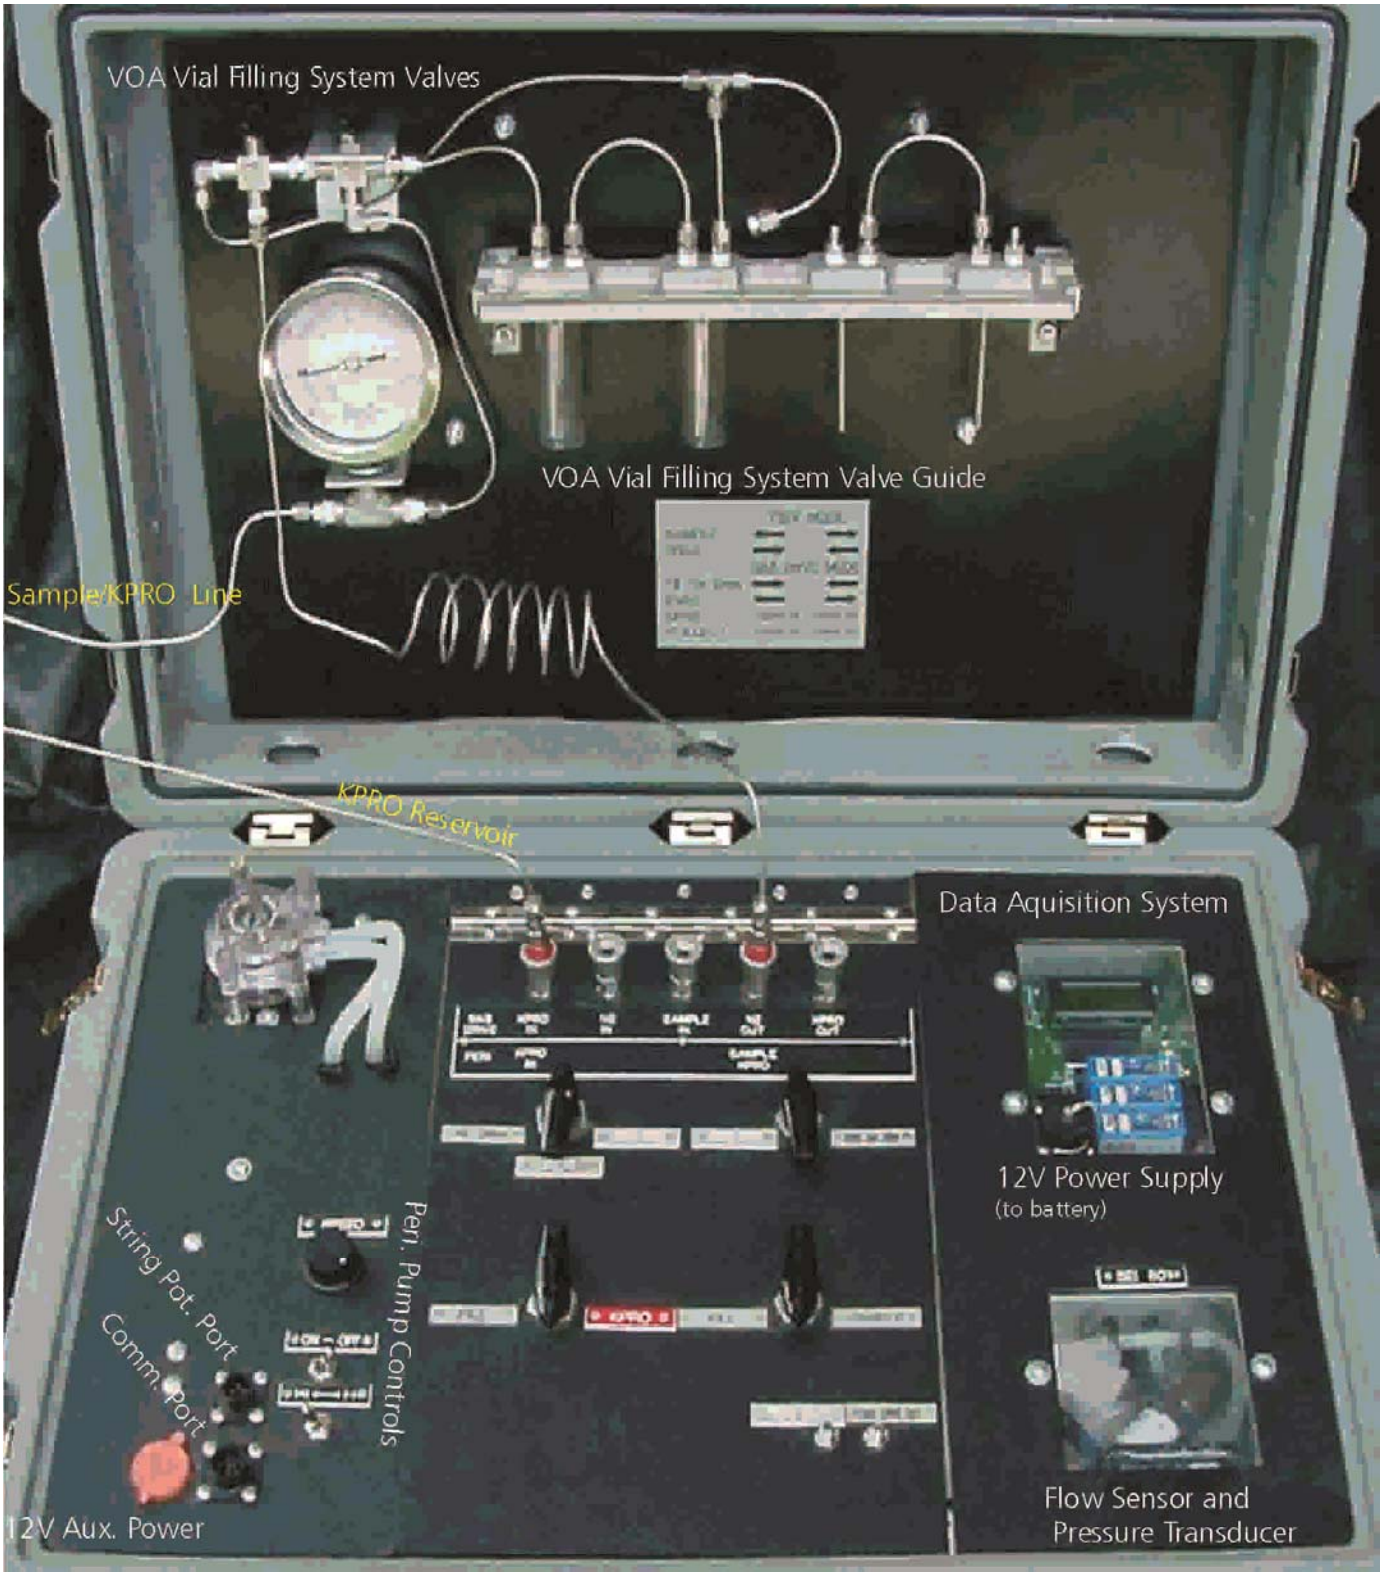
tip contains 6 plates. The plates have a slightly different design than the smaller tips in that the entire plate is more or less a sampling port. The groundwater is obtained using either a peristaltic pump or a gas-drive system (see Figure 4.1 for a schematic of these two profiler configurations).

4.1.3 Volatile Organic Analysis (VOA) Vial Filling System

The system contains as many as four vials connected in-series using stainless steel tubing and specially designed vial holders. The system is designed to mitigate losses of the volatile organic compounds (VOC) by ensuring that no exposure to the atmosphere occurs while the sample is collected. The bottle holders can accommodate up to four 40-mL VOA or 250-mL vials. The vial filling system has been incorporated into the SEI KPRO box. Although the KPRO box utilizes a peristaltic pump, the sample vials are located on the *down hole side of the pump* so that groundwater is pumped through the vials before going through the head of the pump.

4.1.4 KPRO Measurement and Data Acquisition System

The KPRO box consists of four valves, electronic enclosure, peristaltic pump and vial filling system (referred to as the sample jig). The valves can be oriented in a variety of ways in order to send water down and out of the profiling tip or to collect a groundwater sample in both peristaltic and gas drive modes. The following photo illustrates the box setup in peristaltic mode:



KPRO Box in Peristaltic Mode

The KPRO Measurement and data acquisition system consists of the following components:

- McMillan Model 102-4 (20-200mL/min) Flow Sensor
- Sensotec Model TGE/388-02TJA (0-50PSI) Pressure Transducer
- Celesco Model PT5DC-100-V62-UP-Z5-M6M String Potentiometer
- Analog Devices Acquisition System, includes signal conditioners and acquisition board. The removable container that houses the data acquisition system, flow sensor and pressure transducer is referred to as the "enclosure".
- GeoTech Model Geopump peristaltic pump
- Labview KPRO Software Program
- Notebook computer (Toughbook or other)
- USB-Serial Cable or Serial Socket Card
- USB mass storage unit for data back up
- AC/DC power inverter or 12V deep-cycle battery

The following photo illustrates how the entire system looks when it is set up in the truck:

4.1.5 Sonde Water Quality Monitoring Systems

Specific instruction regarding the use, calibration and maintenance of these systems can be found in SEI SOPs 5.27.*n* (Hydro Lab MS-5), 5.25.*n* (Troll 9000 and 9500) and 5.30.*n* (YSI 600XL). When coupled with the profiling equipment, calibrations and verifications are performed weekly rather than daily. If necessary a verification check may be performed at the beginning of a new work day or as needed, however, since these systems are in situ and used to verify three readings prior to sampling, full calibrations are not performed on a daily basis. The YSI 600XL, Troll 9000, Troll 9500, Hydro Lab MS-5, and Hach HQ30 Water Quality Monitoring Systems consists of the following components:

- pH/ORP Probe
- Conductivity/Temperature Probe
- Dissolved Oxygen Probe
- Custom Made Flow-Through Cell.
- 3/8th" Polyethylene tubing

4.1.6 Record Keeping Materials

- KPRO Calibration Log (dedicated to each profiling box).
- Groundwater Profiling Log (electronic and paper).
- Pens
- USB mass storage unit

4.2 General Procedure

The profiling procedure for the peristaltic pump mode and the gas drive mode consists of 6 main steps:

1. Set up of the KPRO box and associated equipment
2. Tip / Pump assembly
3. Adding rod and tubing
4. Drive the tool and acquire index of hydraulic conductivity data
5. Purge water from the system and obtain physico-chemical data from the Sonde water quality monitoring system
6. Collect samples and record data.

4.3 KPRO Box Set Up

4.3.1 Set up common to both Peristaltic and Gas Drive Modes

1. Open the KPRO box and support the top by using the built in wooden tab in the truck or the metal arm and screws that are located inside the KPRO box.

   Plug the AC/DC inverter into the receptacle in the truck. Plug the power cable into the inverter and into the three pronged receptacle on the enclosure of the box.

2. Plug one end of the string potentiometer communication cable into the data port on the panel of the KPRO box and screw the other end into the string pot.

3. Connect the data cable to the Communication Port (COM port) on the KPRO box panel. Plug the other end of the cable into one of the serial ports on the computer or the USB – Serial Cable and secure it using the thumb screws on the cable.

4. Unpack the water quality sonde from its case. Unscrew the cal cup and screw on the flow through cell and connect the power and com cables to the sonde. Connect the com cable to one of the socket ports on the computer. Secure the sonde by putting it into the holder mounted on the counter. Connect a piece of poly tubing to the KPRO box out (peri or gas, depending on which method you are using) and the other to the bottom connection on the flow through cell. Connect a different piece of tubing to the other fitting on the flow cell. The other end of this tubing will go into a graduated cylinder. If you are using a stand-alone dissolved oxygen sensor, connect the "Out" tubing to the flow through cell of the DO meter, then use another length of tubing to connect to the sonde flow through cell.

5. Connect a male swage quick connect to a five foot length of stainless steel tubing and plug it into the female quick connect labeled KPRO In on the KPRO box. Connect the other end to the "out" port on the stainless steel KPRO reservoir using a reservoir quick connect fitting (black band).

6. Fill the stainless steel KPRO reservoir with analyte free water (distilled or spring water). Seal the top and close the pressure release valve.

4.3.2 Set up specific to Peristaltic Mode

1. Attach a low pressure regulator (0-500 psi) to the nitrogen cylinder.

2. Attach a five foot length of tubing to the "in" (white) port on the stainless steel KPRO reservoir using a quick connect fitting. Attach the other end to the outlet port on the nitrogen tank regulator. Open the valve on the nitrogen cylinder and set the regulator to 30 psi.

3. Attach a 20 foot length of stainless steel tubing to the inlet side of the SwageLok® fitting at the bottom of the pressure/vacuum gauge on the top panel. Tighten firmly. This line is the KPRO / sample line and is referred to as the harness.

4. On the KPRO box plug the male quick connect that is attached to the sample jig to the "KPRO Out" female quick connect on the KPRO box (Second from the right).

4.3.3 Set up specific to Gas Drive Mode

1. The gas drive system utilizes two regulators attached to the cylinder by a "T" adaptor. One of the regulators is low pressure (0-500) and the other is high pressure (0-4000).
2. Attach a five foot length of tubing to the "in" (white) port on the stainless steel KPRO reservoir using a quick connect fitting. Attach the other end to the outlet port on the low pressure nitrogen tank regulator. Open the valve on the nitrogen cylinder and set the regulator to 30 psi.
3. Connect a five foot length of tubing to the high pressure regulator. Attach a quick connect to the other end and insert into the "N2 In" female quick connect on the KPRO box. Set the regulator to 80 psi.
4. On the KPRO box plug the male quick connect that is attached to the sample jig to the "Sample In" female quick connect on the KPRO box (middle connection).
5. The harness for gas drive mode consists of three stainless steel tubes which are labeled with colored zip ties. Plug the KPRO line male quick connect (blue) into the "KPRO Out" quick connect on the KPRO box and plug the Nitrogen line (red) quick connect into the "N2 Out" quick connect. The Sample line (yellow) does not have a quick connect. This line connects to the 1/8" Swage fitting on the pressure gauge.
6. Attach a one end of a length of plastic tubing (FEP or other) to the "Peri Out" port located at the bottom right of the KPRO box and put the other end into a plastic 1L graduated cylinder. Attach a similar length of tubing to the "Gas Drive Out" port and connect this to the bottom port on the flow cell of the water quality sonde.
7. Inside each KPRO box is a vent tube, which is a length of poly tubing attached to a quick connect. Connect this tube to the port located on the outside front of the KPRO box.

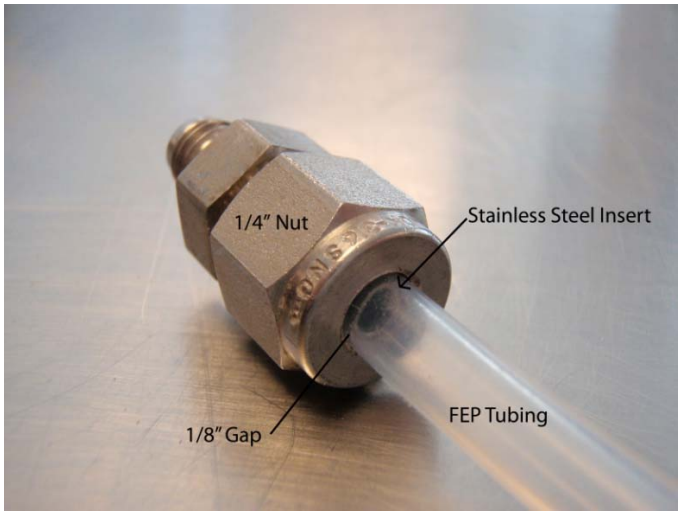
4.4 Tip and Pump Assembly for Peristaltic and Gas Drive Modes

The 1.5 and 1.75-inch profiling tips have 4 plates and the 2.25-inch tip have 6. Behind the plate is a removable mesh screen. The size of the inner screen can be altered to prevent fines from entering the profiler or to maximize flow. Screen mesh sizes range from 40 (coarse) to 120 (fine). 80 size screen is usually the default screen size and can be changed depending on site geology. For peristaltic mode either the 1.5, 1.75 or 2.25-inch diameter tips can be used. With gas drive mode only the 1.75 or 2.25-inch tips can be used.

4.4.1 Peristaltic Mode

A small diameter tube (typically ¼-inch outside diameter fluorinated ethylene propylene, or FEP) is fitted into the threaded hole in the center of the profiler tip by means of a ¼- inch NPT thread to ¼- inch SwageLok® fitting. The following procedure will outline the procedure for assembling the tip and adding rod and drive hardware.

1. Wrap the NPT threads of the ¼- inch NPT to ¼- inch SwageLok® fitting with Teflon tape and thread into the tip. With the tip locked into a vise, tighten the fitting as tight as you can with a 9/16" socket by hand. Most profiling tips already have this fitting installed and if so, there is no need to remove it.
2. Each tip has plates that are attached to the tip via T-25 torx plus screws. Each plate has sampling ports. Under each plate is a mesh screen (40-120 slot). The smaller the slot size the larger the opening is in the screen. The most common screen size used is 80 slot. If there are no plates on the tip first place the mesh screen into the space for the plate making sure to line up the screw holes. Put on the plate and tighten the screws as tight as possible using only a T handle screwdriver or similar tool. Do not use an impact driver as it will over tighten the screws. If you are using a tip that already has the plates installed, double check that the screws are tight.
3. Cut a 6-8" length of FEP tubing and insert a steel barb into each end.
4. For this step it is best to lock the tip into a vise. On the end of the FEP that will attach to the tip, slide a ¼- inch SwageLok ® nut onto the FEP and then slide on a ¼" nylon ferrule. Insert the end of the FEP tubing into the ¼" fitting on the tip making sure that it is inserted as far as it can go. Using a specialized $^{9}/_{16}$" open ended socket, tighten the ¼" nut until there is approximately $^{1}/_{8}$" vertical gap between the top of the steel insert and the nut as shown in the following photo:



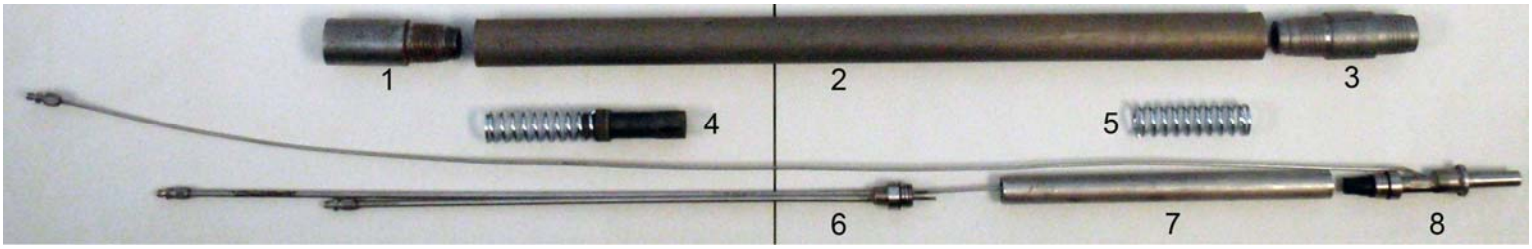
5. For the other end of the FEP, slide on another ¼" SwageLok nut and ¼" nylon ferrule. Insert the end of the FEP into a ¼ "to $^{1}/_{8}$" SwageLok® reducer. Using a ½" and $^{9}/_{16}$" wrench, tighten the nut as before. Be careful to keep the FEP seated tightly into the fitting while tightening.

   When using the 1.5" tip, a male/male adaptor must be screwed into the tip after the FEP tubing is attached to the ¼- inch fitting on the tip. This allows the rod pin to be up so that the GeoProbe drive / slip cap can be utilized. After the adaptor is attached, then the ¼ inch to $^{1}/_{8}$ inch SwageLok® reducer can be attached. The inside diameter of the adaptor is not large enough to accommodate the reducer so it has to be fitted after the adaptor is attached.

6. Gently pull on the reducer after the fittings have been attached to make sure that it is attached properly. If the fittings are over tight then the FEP can snap; if they are too loose than the FEP can pull out of the fitting.
7. A five-foot length of 1.75-inch diameter rod is slipped over the stainless steel tubing with the pin end down and is threaded into the profiler tip. When using the 1.5 or 2.25-inch tip the rod is threaded pin up. This union should also be "stepped on" using pipe wrenches to ensure that it does not vibrate loose. A sacrificial knock out tip should be fitted with two o-rings and the shank of the tip wrapped with Teflon® tape to minimize the movement of silt into the bottom of the tip. Electrical tape should only be used to affix the knock out tip to the profiler if toluene is not an analyte of concern at the site.
8. The top drive cap is then threaded into the top of the 5-foot 1.75-inch rod with the stainless steel tubing protruding through the center of the drive cap. The slotted slip cap adapter is then placed over the drive cap and fitted into the bottom of the hammer on the drive platform. When using the 1.5 or 2.25-inch tip there is no threaded drive cap. Because the rods are threaded pin up, a one piece GeoProbe style slotted drive cap is used instead.

4.4.2 Gas Drive Mode

1. Wrap the NPT threads of the ¼- inch NPT thread to ¼- inch SwageLok® fitting with Teflon tape and thread into the tip. With the tip locked into a vise, tighten the fitting as tight as you can with a $^{9}/_{16}$" socket by hand. Most profiling tips already have this fitting installed and if so, there is no need to remove it.
2. Each tip has plates that are attached to the tip via T-25 torx plus screws. Each plate has four sampling ports. Under each plate is a mesh screen (40-120 slot). The smaller the slot size the larger the opening is in the screen. The most common screen size used is 80 slot. If there are no plates on the tip first place the mesh screen into the space for the plate making sure to line up the screw holes. Put on the plate and tighten the screws as tight as possible using only a T handle screwdriver or similar tool. Do not use an impact driver as it will over tighten the screws. If you are using a tip that already has the plates installed, double check that the screws are tight.
3. Instead of FEP tubing, the gas drive system utilizes a ¼" stainless steel tube ("piston"). To attach the piston, slip a ¼" swage nut and ¼" steel ferrule onto one end of the piston. Insert this end into the ¼" fitting on the tip. It is best to have the tip locked in a vise for this step. Slip the open ended $^{9}/_{16}$" socket over the piston and tighten the nut as tight as you can.



The above photo illustrates the components of the gas drive pump.

1. Pump Housing – Top
2. Pump Housing – Middle
3. Pump Housing – Bottom
4. Top Spring with plastic bushing
5. Bottom Spring
6. Pump Body - top. Sample line is the middle tube and nitrogen is the short
7. Pump Body – middle
8. Pump Body – bottom with reed valve. The KPRO line is attached.

4. The gas drive pump body has three parts, the bottom (which has the KPRO line), the middle and top (which has the sample and nitrogen lines). Look into the narrow part of the pump bottom from the bottom. The piston on the tip will eventually be inserted into this end of the pump. There should be two very small rubber o-rings seated into two slots. If they are present, it is a good idea to replace them. If the o-rings get worn or dry out you will not get a proper seal between the piston and pump.

5. Pry the o-rings out with an angled pick and discard. Rinse out the slots with water. Replace the o-rings using the same pick.

6. Place an o-ring at the base of the threads of the top and bottom pump pieces and wrap the threads with Teflon® tape.

7. Trim a reed valve and place it onto the stub on the top of the pump bottom. In order for the reed valve to fit inside the middle pump piece, the flange of the valve must be trimmed. NOTE: There are two types of reed valves, one for depths shallower than 150' and one for profiles deeper than 150'. The storage container for the valves should be labeled as to which valve is which. Using a reed valves designed for shallow depths in a deeper profile could result in a catastrophic failure of the valve. If the container is not labeled assume the valve us for lesser pressures.

8. Thread the middle pump body onto the top and bottom pump pieces. Lock the middle of the pump into a vise and tighten the top and bottom pump pieces with a $^{9}/_{16}$" open ended wrench until tight. The o-rings should squeeze out of the joint slightly.

9. Slide the plastic bushing and spring over the three stainless steel tubes so it rests snug on the top of the pump. Make sure that the KPRO line is located into the slot on the bushing.

10. The pump housing is comprised of three pieces: the middle 2.4-foot section of rod (with female threads on both ends), the bottom which has two male threads, and the top which has one male and one female thread. The 2.25-inch pump housing has the same parts but the female – male goes at the bottom and the male –male fitting is at the top. Insert the bottom spring into one end of the middle pump housing. Apply Teflon paste or tape to the male threads on all of the pump housing pieces as well as the profiling tip and first drill rod. This will prevent silt from migrating into the pump housing. Screw in the bottom housing piece so that the extended end is inside the pump. Make sure that the spring is at this end of the pump. Insert the pump into the housing. Screw on the top housing piece.

11. Take the profiler tip and slide the ¼-inch stainless steel tube up into the receptacle in the pump bottom. Screw the tip onto the pump housing.

12. With the pump in a vertical position and the tip on the ground, grasp the three stainless steel lines and push them down. You should feel the springs move up and down smoothly. If they don't, the pump must be taken out of the housing and checked. It is very important that the springs are free to move. If they cannot, the vibration of the hammer will damage the pump.

13. **Pressure testing the Gas Drive Pump:** The pump must be pressure tested before it is used to make sure that the o-rings and the reed valve have been installed properly. It is usually a good idea to pressure test the pump after collecting the equipment blank or decontaminating the KPRO box since the pump is attached and full of water. The following steps will lead you through this:

    a. Connect the pump to the tubing harness (all three tubes). You will notice that the three lines coming out of the pump are at three different lengths. The difference in length is the only way to be able to differentiate between them. The KPRO line is the longest, the nitrogen line is the shortest and the sample line is in the middle.

    b. Arrange the valves according to the following photo to start filling the pump:

    c. When a steady stream of water is flowing out of the Peri Out tubing on the KPRO box then the pump is full. Turn the two valves on the sample jig so that they are closed (facing the back of the box). Turn the bottom left valve 90 degrees to shut off the flow. Turn the top left valve to N2 Drive. The pressure on the gauge will rise to where it is set on the regulator. Make sure the pressure is set to around 100 psi or the expected working pressure.

d. Disconnect the N2 Out quick connect on the KPRO box and watch the pressure gauge. If the needle on the gauge is steady then the pump is holding pressure. If the pressure drops then there is a leak. Check that all of the fittings are tight and refill and pressurize the pump. If that does not work, there is a leak in the pump itself (either an o-ring or reed valve) or possibly there is a leaky valve in the KPRO box.

e. **Testing the Bottom O-rings.** If there is not a tight seal between the small o-rings at the bottom of the pump and the piston, KPRO water will not be able to flow into the tip, which will result in inaccurate IK data, sampling of the water inside of the drilling rods and a clogged tip. With the pump pressurized, turn on the flow by turning the bottom left valve on the KPRO box to KPRO. You should see water flowing out the tip. Grasp the pump just above the tip and invert the pump at a 45 degree angle so that your hand blocks the flow of KPRO water. If you see water flowing out of the pump housing then it is possible that the o-rings are leaking and they need to be checked.

NOTE: A more reliable way to determine if there is a leak is to check for air bubbles flowing through the vials while collecting the equipment blank. Double check that all of the fittings on the harness, KPRO box and pump are tight. If there are still bubbles then the o-rings need to be checked. Refer to section 4.9.3 on equipment blank procedures.

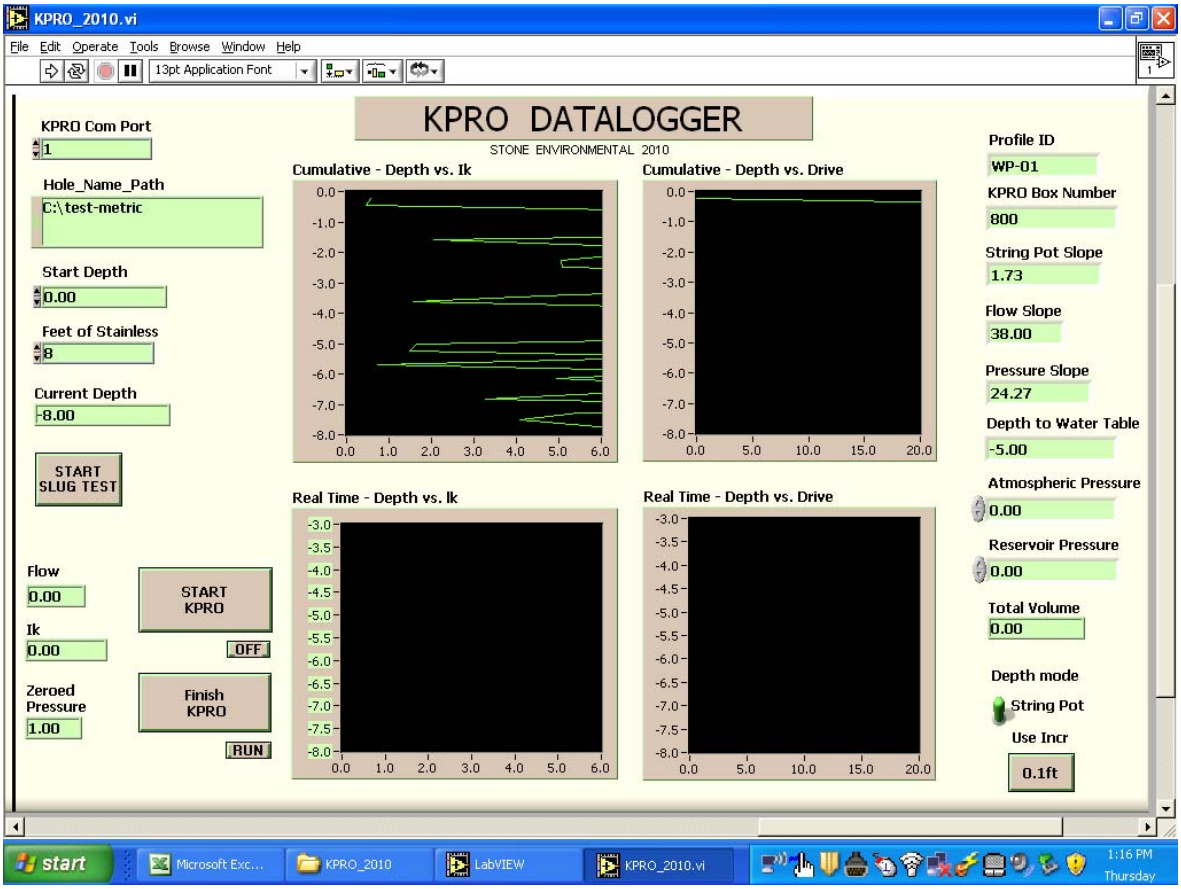
14. Add a 20-foot length of stainless steel tubing to each tube fitting leading from the pump.
15. Slide a 5' drill rod over the stainless steel tubing and screw it into the pump.
16. Tighten all joints by firmly by standing on the pipe wrench. To do this put one pipe wrench so that it is resting on the ground. Place the middle of the pump into the wrench. Put the other wrench on the tip and stand on it, making sure that the other end of the rod is weighted down (have a helper stand on it). This will tighten the tip and the bottom pump housing piece. Repeat for the top of the pump and rod.
17. The top drive cap is then threaded into the top of the 5-foot rod with the three pieces of stainless steel tubing protruding through the center of the drive cap. The slotted slip cap adapter is then placed over the drive cap and fitted into the bottom of the hammer on the drive platform.

4.5 KPRO Software Calibration and Startup

4.5.1 Calibration

The KPRO box should be calibrated at the beginning of a new project and once weekly (or every 5 days if there is a longer shift). If an individual sensor or entire electronics enclosure is replaced then there should be a recalibration. The calibration is saved on the field computer, so if the KPRO box was calibrated with a different computer then it needs to be recalibrated.

1. At this point the computer should be plugged in and booted up. If not, do so now.
2. Find the KPRO program icon on the desktop or located in the C:\KPRO_2010 folder. The program is named "KPRO_2010.vi". Double click on the icon. The Labview software will load and the KPRO software will look like this:



KPRO Software

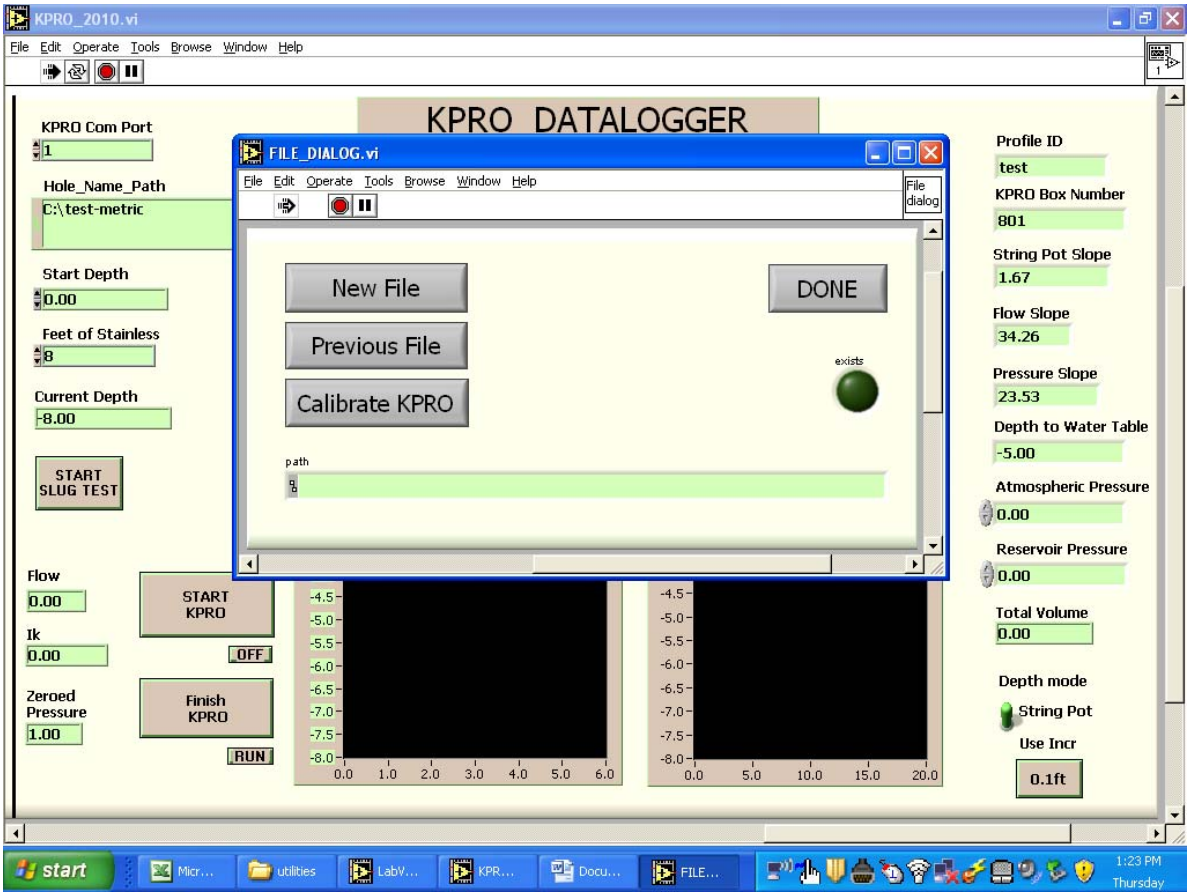
3. Make sure that the correct COM port is provided for the KPRO box before starting the program and correct it if necessary. The text box for the COM port is located at the top left of the above figure. The COM port located at the back of the computer is COM1.

   When using the USB-Serial cables navigate to Control Panel /System/Device Manager and scroll down to Ports. The cable will be listed as "Prolific USB-Serial" and the com port assignment will be listed. For the socket cards, click on the icon for the socket driver located in the taskbar to see which COM port numbers have been assigned to the socket card (On the figure above it is the symbol fourth from the left at the bottom right of the screen).

4. Start the KPRO program by clicking on the right arrow icon on the top left menu bar (above the COM port text box). There is no need to enter any data before starting the program (other than the COM port for the KPRO box), as the program will populate the fields or prompt you to enter a value.

5. A window opens and prompts you to enter the number of the KPRO sample box that you are using (800 through 809). Enter the number and select the enter button.

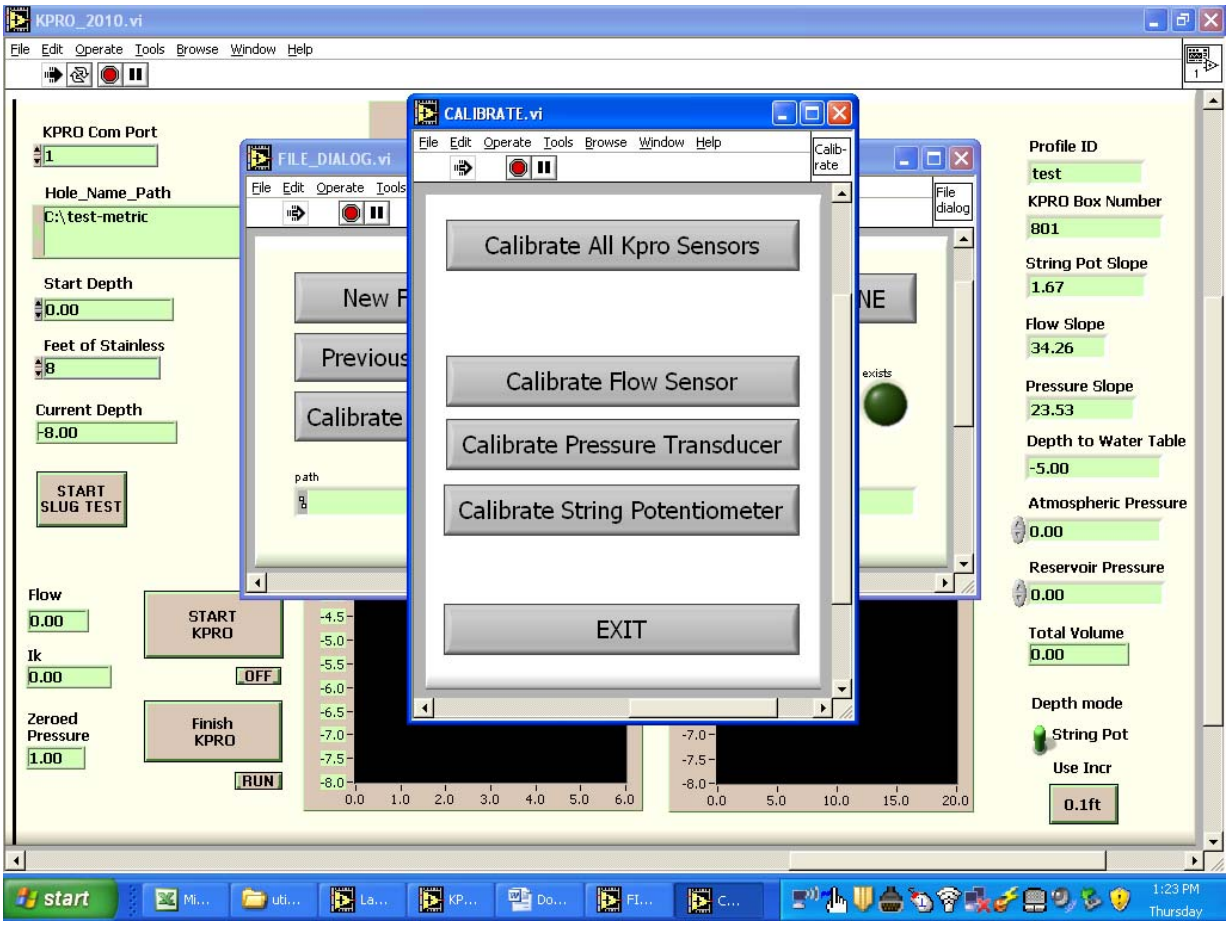
6. A window opens and prompts you to enter the profile ID. Enter the ID and select the enter button. The following screen will load.



Startup Screen

7. Select CALIBRATE KPRO. Make sure that there is at least a 20' foot length of stainless steel tubing attached to the profiling box when calibrating. This will ensure accurate calibration of the flow and pressure. Using a smaller piece of tubing can adversely affect the validity of the calibration.

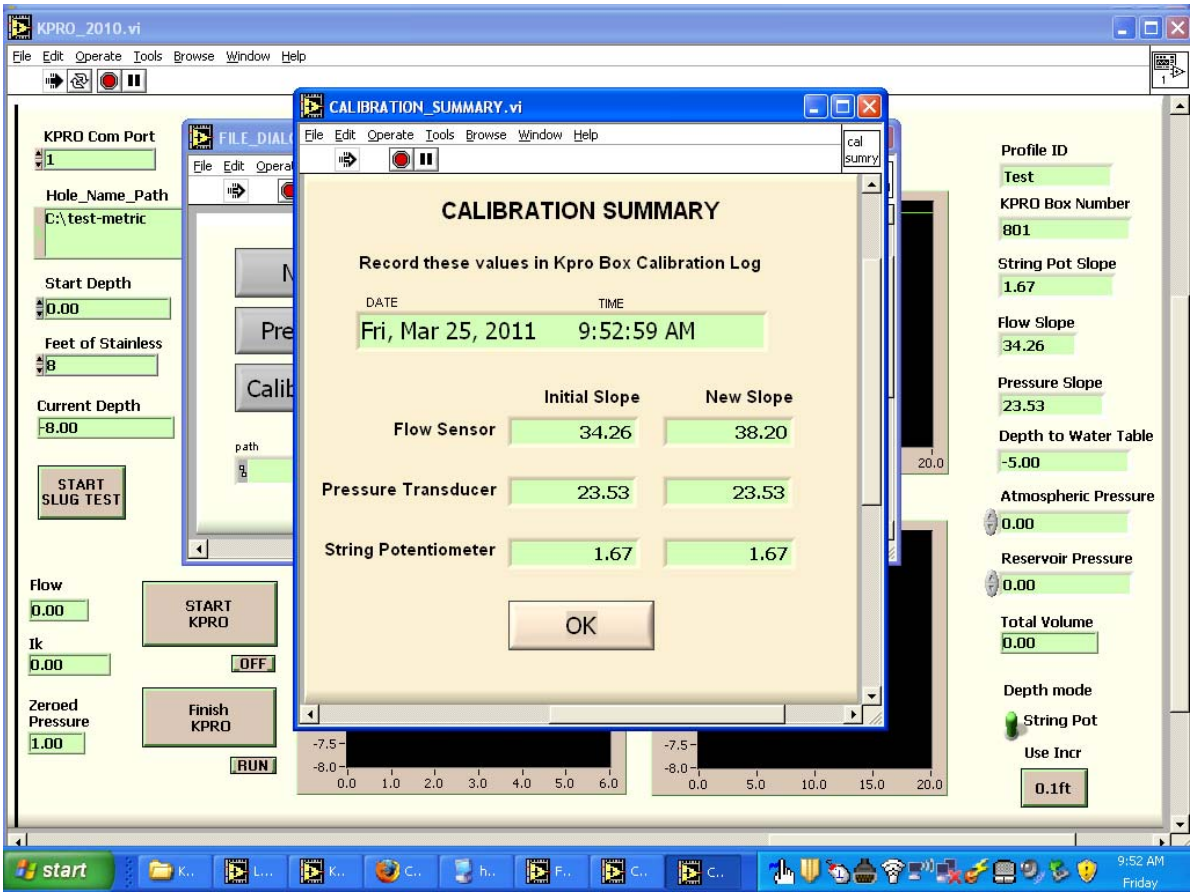
8. The next screen allows you to calibrate all of the sensors or each individual sensor (string pot, flow and pressure).



Calibration

Select the "Calibrate All KPRO Sensors" or the button corresponding to each individual sensor (if you do not need to calibrate all of the sensors). The program will then lead you through the calibration. Follow the directions on the screen to calibrate the flow, pressure and string pot. After calibration is complete, if you feel that one or more of the sensors was not calibrated correctly, you can repeat the entire calibration or just repeat the calibration for an individual sensor. If you decide to recalibrate one or all of the sensors, be aware that the program will use the original slopes and not the newly calibrated slopes for the recalibration.

9. After calibration, a summary screen will open.



Calibration Summary

Record the initial and new slopes in the calibration log (yellow book in the KPRO box) for the KPRO box you are using. Slope values should be within the following parameters: string pot 1.6-1.8, flow 32-38, and pressure 22-28. (There are a few string pots that have longer cables than normal and as a result will have a slope value double the normal value, usually around 3.2-3.6). If the slopes are off from these values, recalibrate. If that does not work, you may need to change out the pressure transducer, flow meter or string pot. Select the OK button to exit this screen.

Note: The program records the slope values in two files located in the C:\KPRO_2010\Output_Files folder. The file named "slopes.txt" is used by the KPRO program to import the slopes the next time it is started and after calibration. The other file, "cal-slopes-record.txt" is used only as a record of the calibration (it records date, time and KPRO box number as well as the slopes). Do not delete the files or any of the data in them or move them to a different folder. **Additional Note**: If the calibration slopes are off due to a calibration error, simply go through the calibration process again. If you are having problems calibrating, see the KPRO Problem Solving Guide for more

information. It may be necessary to delete bad slope values from the slopes.txt file in order to calibrate the box. The software uses the old slopes to calculate the new slopes, so if the slope that the software is using is way off, it may not be possible to get a good new slope using this value. If this seems to be the case, open the slopes.txt file and delete the entire line of bad data. Save and close the file.

4.5.2 Startup

1. After calibration or after clicking on the start button, the startup screen will load (Figure 4.5-2). If you are starting a new profile, select NEW, and if you are continuing a profile select PREVIOUS. There may be a path to the file you want to use already displayed in the box at the bottom of the screen. You still need to select the PREVIOUS button and navigate to the file. When starting a new profile, after selecting NEW, navigate to the C:\Projects\Project Name\kpro_raw folder and name and save the file. Name the file the same name as the profile ID. There is no need to add a file extension (.txt, .doc) as the program will add its own. The program will then create a file by adding "_KPRO.txt" to the end of the filename. For example "WP-01" becomes "WP-01_KPRO.txt". If you selected PREVIOUS, after navigating to and selecting the file, the green indicator light next to the word "exists" will be illuminated. Make sure to select the filename with no extension when selecting an existing file (for example, select "WP-01" and not "WP-01_KPRO.txt"). Select DONE. You will now begin the software startup procedure.

2. The first window that appears is for setting the atmospheric pressure. Follow the instructions on screen to set the pressure. If there are only zeroes in the atmospheric readout, there is a problem with the connection between the KPRO box and the computer (incorrect COM port, bad cable) or the slopes file has been corrupted. Refer to the KPRO Problem Solvers Guide for more information. Record the atmospheric pressure on the Groundwater Profile Log. The atmospheric pressure reading should be close to 34 feet of water. If the reading is higher or lower by a few feet, the pressure transducer needs to be calibrated. This value can also change depending on where you are profiling (high or low elevations, Europe, etc). It is a good idea to check the local atmospheric pressure.

3. The next window is for setting the KPRO vessel pressure. Follow the instructions on screen to set the pressure. If the pressure is too high, turn the handle on the regulator counter-clockwise and release some pressure from the KPRO vessel by using the valve on the top of the vessel. If the pressure is too low, turn the handle on the regulator clockwise and allow pressure to stabilize. After adjusting the pressure make sure that the pressure has stabilized and is not falling or climbing before clicking the OK button. Record the pressure on the Groundwater Profile Log.

4. The next window will prompt you to enter the start depth. If you are continuing a profile, the last recorded depth will be provided. You can use this depth or enter a different depth. When entering a depth you can enter a positive or negative value; the program will make it negative regardless of the sign that was entered.

5. The next window will prompt you to enter the height of the sample box above the profile location. Measure the height from the ground to the pressure transducer and enter it. When profiling out of T5, T6, T7 or T8 the height is 7 feet. When profiling out of T9, the height is 5 feet. The value will be different if you are profiling out of a different vehicle or other situation. If the ground between the truck and profile location has a significant slope, this also must be accounted for.

6. The next window will prompt you to enter the depth to water. If you are continuing a profile, the last recorded depth to water will be provided. You can use this depth or enter a different depth. If you do not know the depth to water, you must make an educated guess. You can enter a more accurate depth later. When entering a depth you can enter a positive or negative number. Make sure you enter the depth to water from ground surface, not from the height of the KPRO box.

7. The last window will prompt you to zero the pressure to the ground at the profile location. Make sure that the graduated cylinder is placed on the ground as close to the profile location as possible. Follow the instructions on screen and select OK. The setup is now complete and the profiling can begin.

8. **Recording Data** - Navigate to and open the Microsoft Excel "Groundwater Profiling Log with Plot" template. This file should be located in the C:\Forms folder or in the file template in the Projects folder. Rename the spreadsheet to reflect the profile name (e.g. Groundwater Profiling Log _WP-01.xls). Select the tab labeled "Groundwater Profiling Log". Fill in the top section of the log. The bottom section of the log will be empty at first but will be populated with data for each separate groundwater sample. The following photo shows the log after sample data has been entered:

Groundwater Profile Tab

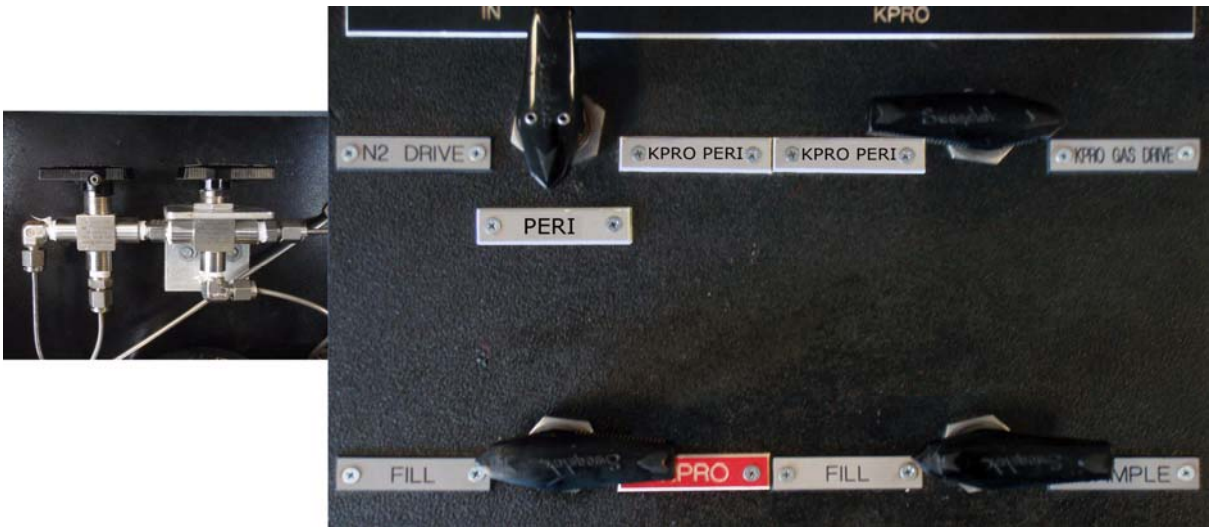
4.6 Drive the Profiler/Acquire I_k data for both Peristaltic and Gas Drive Modes

1. Attach the harness to the tube or tubes sticking up out of the top of the profiler rod at the drive platform. Place the string pot on the ground next to the drill rig and weight it down with a pipe wrench or the rod puller. Pull out the string and attach it to head of the drill dig.

2. **Peristaltic Mode**: turn on the KPRO flow by arranging the valves as shown below:

Peri Mode - Drive

Gas Drive: fill the pump by arranging the valves per the photo below:



Gas Drive Fill Pump

When the pump is full and a steady stream of water is flowing out of the Peri Out, lock off the pump (turn the valves on the sample jig so they face the back of the box), pressurize and turn on the flow per the following photo (make sure to lock off the pump first).

Gas Drive - Driving

3. With the flow on, put the profiling tip / rod assembly into the pre-cleared hole or so that the tip rests vertically on the ground surface. Have the driller lower the head of the probe so that the anvil of the probe rests on the slip cap. At this point the driller will adjust the probe so that the drill rod and probe are straight and level. **Note:** Make sure that the driller has broken through any surface concrete or asphalt. Driving through either of those will damage the tip.

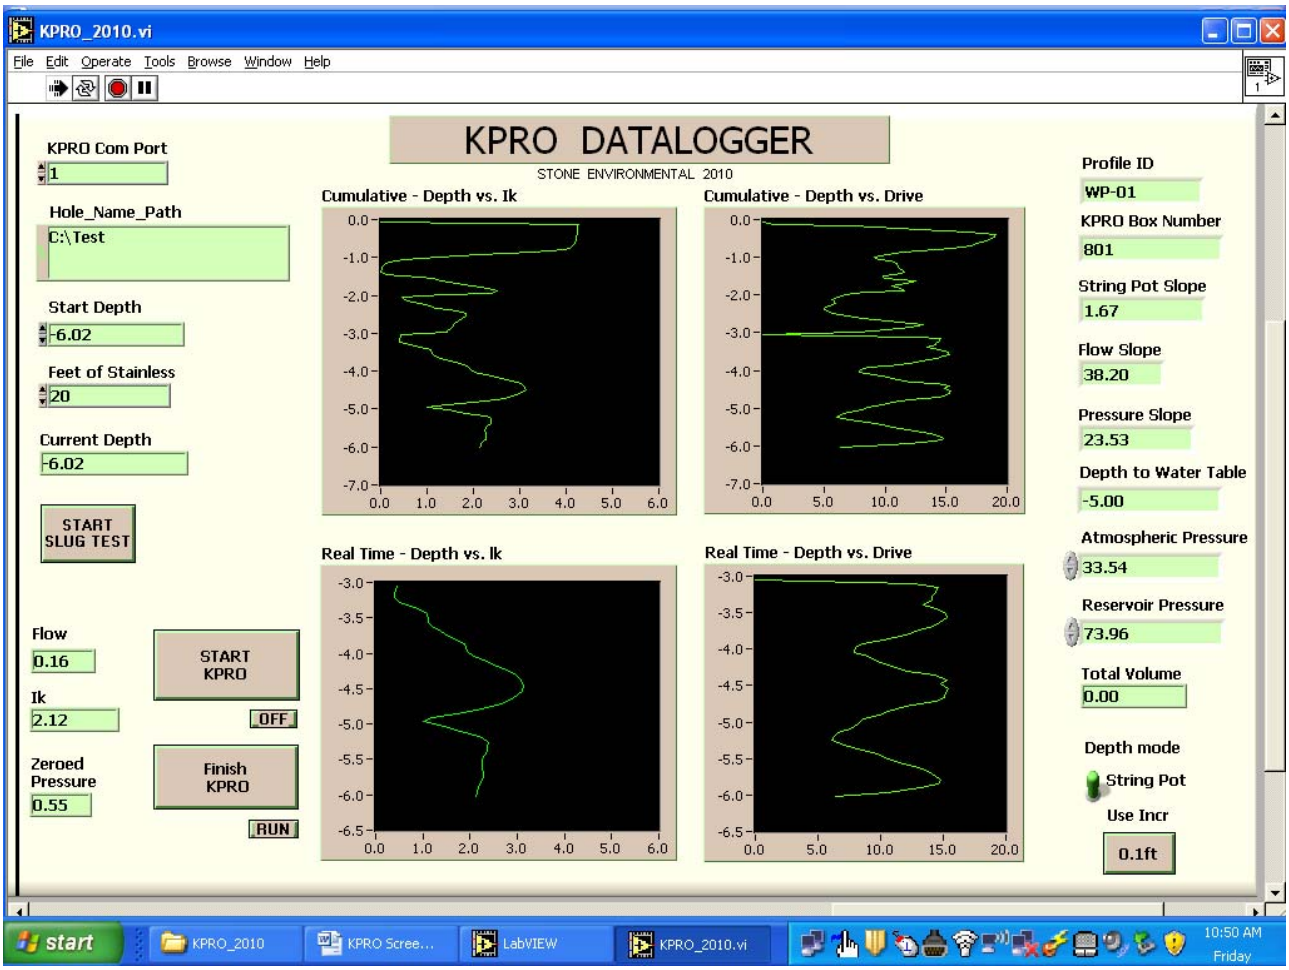
4. When the flow value stabilizes click on the Start KPRO bottom at the bottom of the KPRO software. Make sure that the string put is extended and the head of the drill rig is resting fully on the slip cap before starting the software. The software will not read the depth correctly if it is started before the string pot is extended.

5. A window will open asking the depth to water. If this is the first drive, the depth provided is the depth entered during the startup procedure. If this is your second drive and the head measurement collected at the first sample location is different from the value originally entered, a new depth can be entered here. Enter a new depth or select OK. A pop up window will open showing the feet of stainless steel tubes. Set the feet of SS tubing to the correct feet of tubing used, including the 20' harness.

6. Signal to the rig operator that you are ready to commence driving the profiler. Just before the profiler begins to move, hit the Go button on the software.

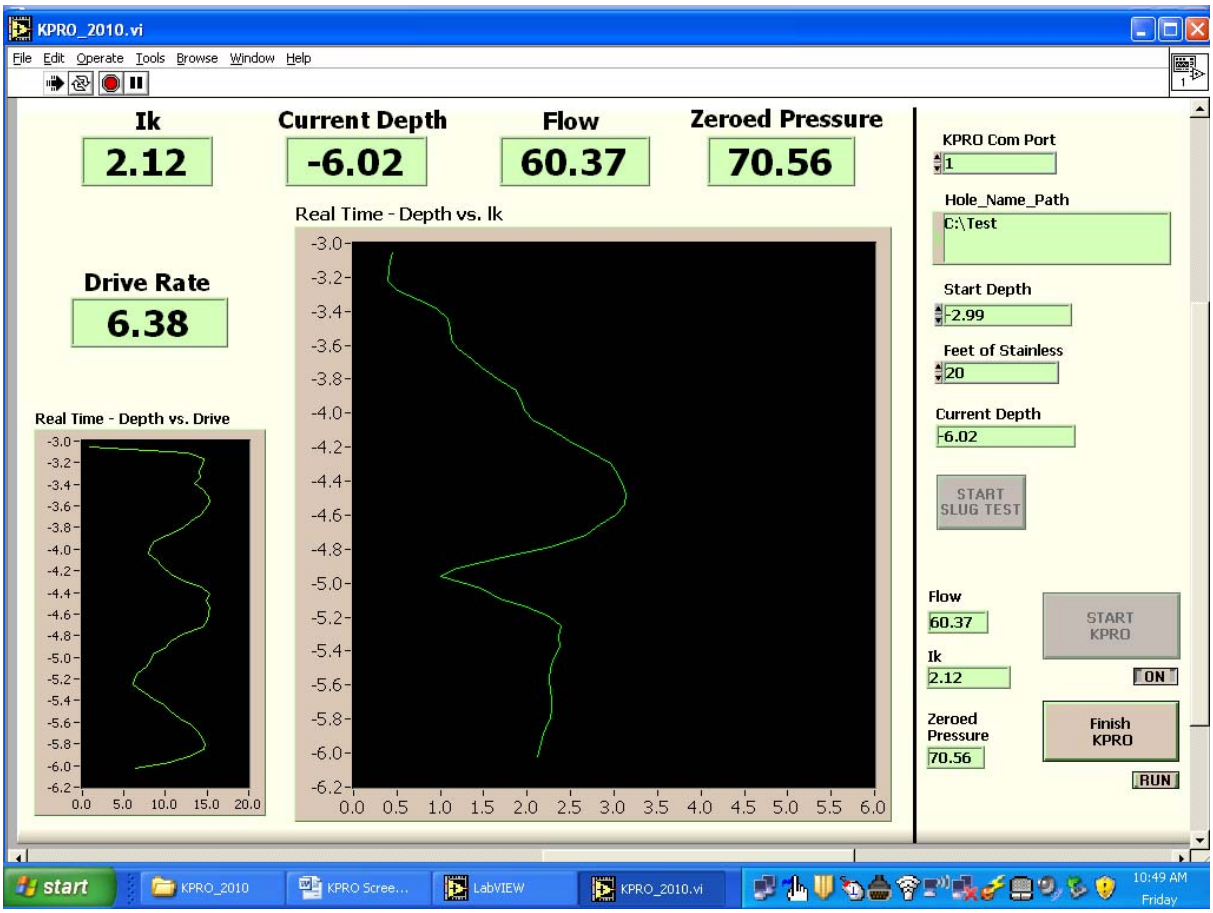
   Notes on the string pot: 1. The KPRO software only records data while the string pot is moving. 2. If during a drive the driller needs to lift the probe, there is no need to stop the KPRO software. The software will only record data once the string pot has moved past the last recorded depth.

7. Observe the I_k plot on the screen as the tool is advanced as shown in the following figure:



KPRO Software Screen While Driving

The current I_k , flow and pressure are displayed at the bottom left of the screen. The I_k for the current drive is displayed in real time in the graph at the lower left. The cumulative I_k for the entire profile is displayed in the graph at the top left. The drive rate (feet/minute) for the current drive is displayed in the bottom right graph, and the cumulative drive rate is displayed in the top right graph. A larger I_k plot can be seen by scrolling the software screen to the left. The screen looks like this:



KPRO Software Screen While Driving

Notes on I_k: I_k can range from 0 to 6+. Fine grained (silts and clay) or compacted sediment will have an I_{kv} towards the lower end, and sands, gravels and looser material towards the middle to higher end. The software will correct the Ik for depth using a head loss equation, so I_k should remain relative for the profile regardless of how much stainless tubing is attached (even though the flow is lower and the pressure is higher). I_k is only calculated and recorded by the software if the string pot is moving. In some cases the flow will drop after hammering has stopped, which results in a lower I_k. Since the string pot is not moving this new I_k value is not displayed on the screen and is not recorded. In this case take note of the flow, because the flow reading on the software is constantly updating, whether or not the string pot is moving. I_k behavior when tooling advance has stopped should be recorded on the "Profile Info" tab of the Groundwater Profiling Log (see below).

8. When you reach a zone that you wish to sample, signal to the rig operator that he/she should stop. When he/she stops press and hold the Finish KPRO button down until the icon (located below the button) changes from Run to Done.

9. **Determining whether to sample or not:** Observe the flow. If the flow drops significantly it may be an indication that the sample interval will not yield a timely sample. If the flow stays the same or increases, then it is probably a good interval to sample. In the Groundwater Profiling Log there is a "Profile Info" tab. The purpose of this worksheet is to record additional data regarding the driving and sampling of the profiler.

I_k and Sample Attempt Log

STONE ENVIRONMENTAL INC

Client:	ERM			Profile Location:	APS-018
Date:	5/27/2010	KPRO Box Serial #:	808/ Rasc7	Gas Drive or Peri Pump:	Gas
Location:	Plainville, CT	Troll Serial #:	o2k0934 YSI	Atmospheric Pressure:	34.89
SEI #:	092193-R	Drilling Contractor:	Platform	N_2 Pressure (set via P tranducer):	70.14
Sampler(s):	VLD	Depth to Water:	-17.28	Gas Drive Pump N_2 Pressure:	80-100

Depth (ft)	I_k Behavior Type		Unsuccessful Sample Attempt		Hole Termination Type		COMMENTS
-8.00	No change when hammer stops	3		#N/A		#N/A	
-13.00	No change when hammer stops	3		#N/A		#N/A	
-18.00	No change when hammer stops	3		#N/A		#N/A	
-23.00	No change when hammer stops	3	Could not produce water	4		#N/A	
-26.70	IK increase when hammer stops	2		#N/A		#N/A	
-28.00	No change when hammer stops	3		#N/A		#N/A	
-33.00	IK decrease when hammer stops	1	Yield deemed too slow	6		#N/A	
-38.00	No change when hammer stops	3		#N/A		#N/A	
-41.00	No change when hammer stops	3		#N/A		#N/A	
-48.00	No change when hammer stops	3		#N/A	ROP dropped below threshold	9	

Profiling Info Tab

Each time the hammer is stopped (to add rod, sample, determining whether or not to sample), the I_k Behavior column must be filled in. Record the depth and behavior type from the drop down menu.

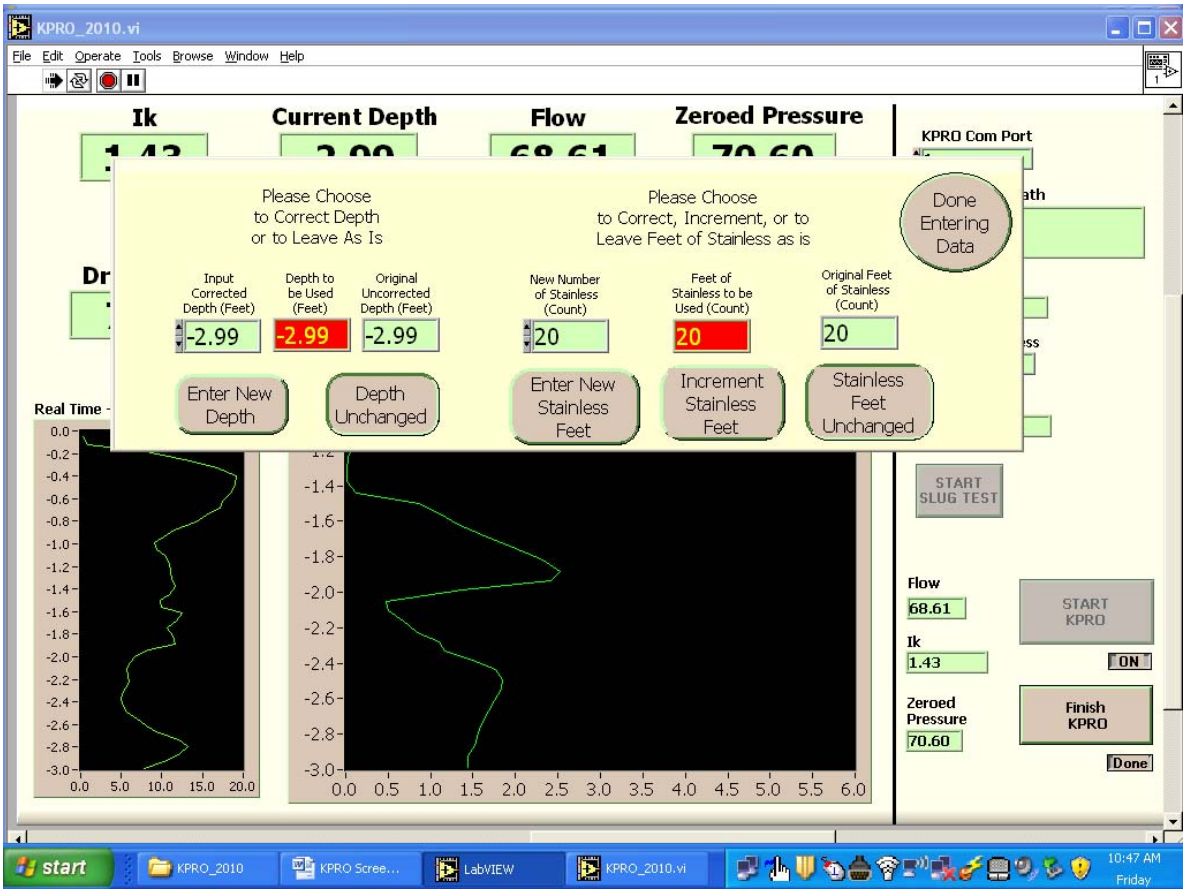
It will take experience to get a feel for which intervals will yield fast samples and which will not. The I_k and flow are a good indication as to which samples will be fast or slow but remember that the flow decreases with the amount of stainless tubing that is

attached. So at shallower depths a flow of 60 ml/min may be slow but at a depth of 60 feet it may be fast.

10. Turn off the KPRO flow by turning the lower left valve from the red KPRO label 90 degrees to an off position.

11. Measure the stick up from the ground surface to where the drive cap abuts the top of the 1.75-inch rod, or to the shoulder if using the 1.5 of 2.25-inch rod. Subtract the stick up from the total length of rod in the ground including tip and/or pump. For peristaltic, the tip length used is 0.4 feet. For gas drive, the length of the tip and pump is 3.2', so add this to the length of rod in the ground.

12. Compare the measured value to the depth reading on the screen:



Correct Depth

If the measured depth is different than the depth given in the "Original Uncorrected Depth" box, enter the correct depth into the "Input Corrected Depth" box and click on the "Enter New Depth" button. You can also change the feet of stainless if required. If no other data needs to be corrected, click on the "Done Entering Data" button on the software.

13. **Measuring Hydraulic Head**: Observe the Zeroed Pressure text box. When this value equilibrates, record the value on the field form along with the depth (Attachment 2). The water in the stainless steel tubing will equilibrate to the head of the groundwater when the flow is turned off. Turn on the flow and leave it on for 30 seconds. Turn off the flow and again observe the Zeroed Pressure and wait for equilibration. If this value matches the first value, the head measurement is valid. If it is different, repeat turning the flow on / off until two successive head readings are obtained.

    NOTE: When the water table is at a depth of more than 25' the head value is not valid. When using gas drive mode this is often the case. If so do not record the head value.

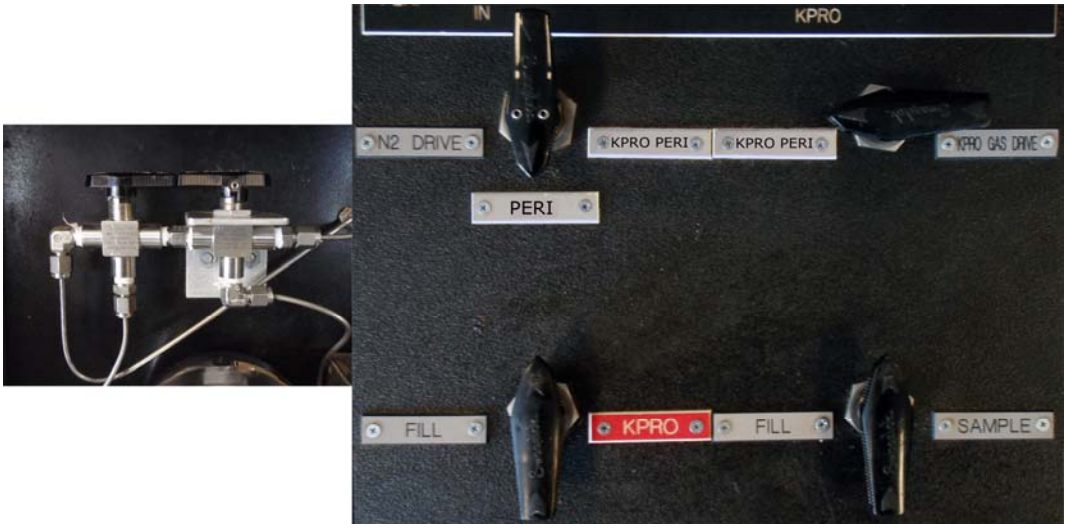
14. Double click on the appropriate Sonde water quality monitoring system icon on the notebook computer desktop (Ecowatch for the YSI, Win-Situ for the Troll, and HydraS3 LT for the Hydrolab). Instructions on how to operate the specific software for each Sonde can be found in SEI SOP 5.27.*n* (Hydro Lab MS-5), 5.25.*n* (Troll 9000 and 9500) and 5.30.*n* (YSI 600XL).

15. **Missing a sampling interval**. It may be required to pull the profiler up to sample an interval that was passed on the way down. To do this first make sure that the "Finish KPRO" button has been clicked. For Peri mode make sure that the flow is on, and in gas drive mode make sure that the pump is pressurized and the flow is on. Determine at what interval you would like to sample. Hold a measuring stick next to the drill rod as the driller pulls back on the rod and have the operator stop when the depth is achieved. Check the flow on the software to be sure that the interval will yield a timely sample. It is also possible to watch the flow on the KPRO software as the driller pulls the rod up. When the flow increases, tell the driller to stop. Measure the stickup and record in the paper log that the profiler was pulled up and record the new depth. Before your next drive you will have to correct the depth in the KPRO software. To do this do a "fake" drive by starting and stopping the software as you would during a drive but correct the depth to the new depth. You can also mark the rod before pulling it back and then drive the rod back to that depth (with the flow on) before starting the program.

4.7 Purging the Profiler and Sample Collection

4.7.1 Purging in Peristaltic Mode

1. Turn on the peristaltic pump and set the +/- selector to –
2. Set the valves shown below.



Peri Mode Purging

3. Observe the vacuum gauge. A vacuum should build toward -30 inches of mercury
4. Observe water flowing through the bottles. The water will be clear at first but should become silty. This is because there is some KPRO water still in the tubing.
5. If vacuum does not build and water does not flow it is possible that there is a leak in the system. Refer to the Problem Solver's Guide on how to proceed.
6. Observe the volume of water in the graduated cylinder into which the purge water discharges. On the Groundwater Profiling Log, select the tab "Sample 1". The top section of the sheet except the date should be populated with data that was entered on the first tab. Record the time, cumulative purge volume and physio-chemical parameters in the Excel spreadsheet after every 50-100 mL of sample discharges to graduated cylinder. This data is used as a benchmark for future readings and is not recorded in the field form (paper log).
7. If the sample purge rate is slow (less than 10 ml/min) then it may be necessary to surge the pump. Sometimes silt can get smeared on the outside of the profiling tip or can be drawn into the tip. Surging the pump can loosen up the silt to increase the flow. Reverse the flow of the pump by turning it off, then switching the directional switch. Turn the pump back on and observe the pressure gauge. Once the gauge maxes out, turn off the pump and reverse again. Repeat this two to three times. Continue to purge the sample. If the purge rate is still slow, it may be necessary to drive the profiler to a better sampling interval. If no sample was collected, record this in the Profile Info tab of the log.

8. When all of the physico-chemical parameters stabilize on two successive readings (separated by 50-100 mL, indicated by yellow in the Microsoft Excel worksheet) record the depth, time, head value, total volume purged and the values of the physico-chemical parameters on the paper field form (only record the final line of stabilization parameters). The paper log serves as a backup in case there is a problem with the electronic Groundwater Profiling Log. Put any character in the column labeled "Final ?" (located to the left of the depth column) next to the last row of data. This tells the spreadsheet to display that row of data on the "Groundwater Profiling Log" tab. The following photo illustrates what the data looks like for a sample that has equilibrated.

PARAMETER EQUILIBRATION LOG

Sample Log Showing Equilibrated Sample

Notes on Purging the Sample: Make sure to purge at least 500ml before collecting a sample. The first few physico-chemical readings may indicate that the sample has equilibrated but that is because the tubing contains the analyte free water and there is still water from the previous sample interval in the flow through cell of the water quality sonde. The volume of the flow cell is usually 100-200 ml, so it will take some time for the groundwater from the current interval to replace the water in the flow cell from the previous sample. There are conditions where stabilization of Dissolved Oxygen and ORP values may not be practical. When Dissolved Oxygen values are less than 1 mg/L and ORP values approach 0 after an acceptable volume of water has been purged (usually 600ml for peristaltic and 800ml for gas drive), a small change in the value can result in a change greater than the stabilization criteria of 10%. In these

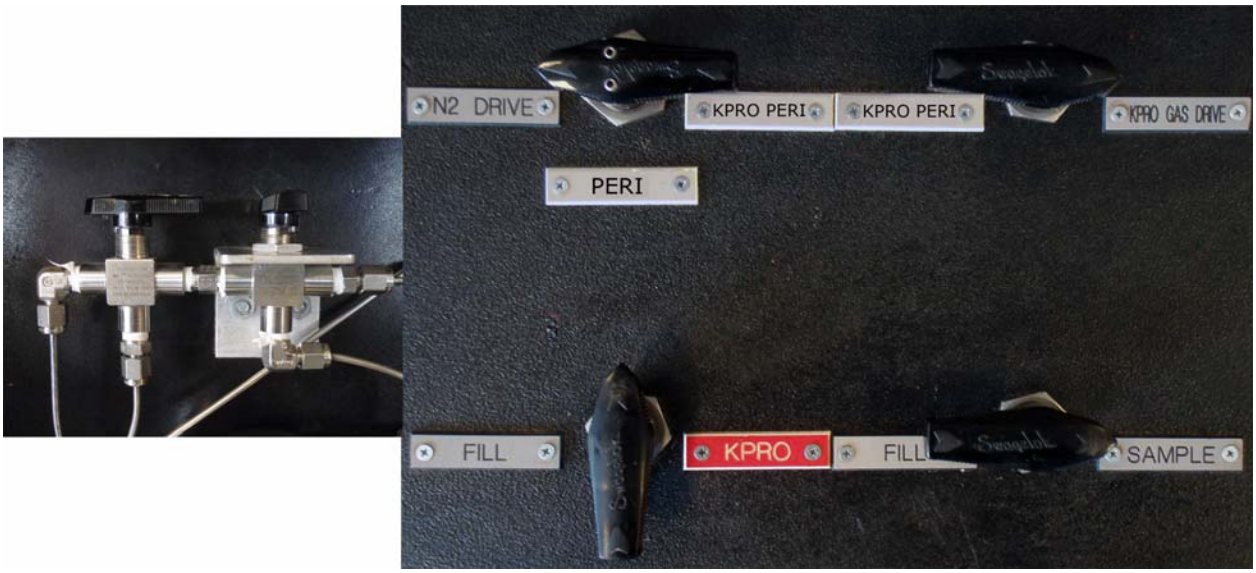
situations the sampler can collect the sample before these values have stabilized as long as Specific Conductance and pH are stable.

4.7.2 Collect Sample in Peristaltic Mode

1. Turn the top right valve on the sample jig so that it is locked off (pointing towards the back of the box).
2. Reverse the direction of the pump by changing the toggle switch on the box panel from minus (-) to plus (+).
3. Run the pump backward for 2 to 3 seconds
4. Shut off the pump
5. Remove the sample bottle on the left.
6. Remove the bottle on the right.
7. If there is headspace in the tops of the vials (this is normal), hold a vial cap under the right bottle holder and run the pump in reverse slowly. Water will flow into the vial cap. Transfer this water from the vial cap to the vials until the headspace is gone and cap the vial. Turn the vial upside down and tap the vial lightly on the palm of your hand. If there are any air bubbles present, you must uncap the bottle and repeat the headspace procedure.
8. Label the vials appropriately. Note the time of sampling on the field form.
9. Replace the vials with new vials. Prepare to drive as before after adding tubing and rod as necessary.

4.7.3 Purging in Gas Drive Mode

1. At this point the pump is already pressurized from driving. Arrange the valves per the following photo:



Pressurized Gas Drive Pump Ready to Purge

Turn the top right valve on the sample jig slowly to the right. This allows the nitrogen to push the water up from the pump and through the sample jig. The pressure on the gauge will drop and stabilize as the water flows.

2. Observe the pressure gauge. Just before the pump body is completely emptied, the pressure will start to rise. When you observe the rise, turn the top left valve on the KPRO box 90 degrees clockwise, which will stop the flow of nitrogen and vent the gas out of the pump (you will hear a hissing sound).

3. Watch the pressure gauge and when the pressure drops below zero, lock off the right valve on the sample jig and spin the top left valve on the KPRO box clockwise to Peri. Make sure that the peristaltic pump is on. At this point the pump is depressurized and is filling with groundwater. These three steps complete one pump purge, or "whack".

4. Observe the volume of water in the graduated cylinder into which the purge water discharges. Record the time, cumulative purge volume and physico-chemical parameters in the Excel spreadsheet after every purge of sample discharges to graduated cylinder. This data is used as a benchmark for future readings and is not recorded in the field form (paper log). The first whack will be larger than most because the pump and lines are already filled with water. If after the second whack the amount of sample discharged is less than 80 ml then you need to wait longer between evacuations (3-4 minutes). If after waiting 5-6 minutes the pump evacuation yields less than 50 ml, it may not be prudent to collect a sample at that location. Check with the client oversight to see if they want you to continue sampling or drive to a better sampling interval. If

the volume is significantly larger (150-200ml) you can evacuate the pump more often (1-2 minutes). If no sample was collected, record this in the Profile Info tab of the log.

Note on purge volume: The volume of the gas drive pump is 100 ml. The volume of the stainless steel tubing is 0.8 ml/ foot, and there are two lines (the sample and gas lines) that are full of water (water from the previous sample and water used to fill the pump). For example, if you have 60 feet of tubing attached, the volume would be 100ml + (2 *60*0.8), for a total of 196 ml. When purging a sample this water will be purged first so the physico-chemical parameters may appear to be stable. It is common to see the parameters rise (previous sample water left in pump), then fall (analyte free water used to fill the pump) before starting to equilibrate (fresh groundwater).

5. After the previous whack, allow some time (as explained in step 4) for the pump body to fill such that you receive at least 50 mL of sample on subsequent evacuation (Step 4).
6. To purge the pump turn the top left valve on the KPRO box to N2 and watch the pressure gauge. When the pressure crosses zero, turn the top right valve on the sample jig to the right. You are now back at Step 1. Follow the rest of the steps to complete the whack and record the parameters.
7. When all of the physico-chemical parameters stabilize on two successive readings (indicated by yellow in the Microsoft Excel worksheet) record the depth, time, head value, total volume purged and the values of the physico-chemical parameters on the paper field form. The paper log serves as a backup in case there is a problem with the electronic Groundwater Profiling Log. Put any character in the column labeled "Final ?" next to the last row of data. This tells the spreadsheet to display that row of data on the "Groundwater Profiling Log" tab. There are conditions where stabilization of Dissolved Oxygen and ORP values may not be practical. When Dissolved Oxygen values are less than 1 mg/L and ORP values approach 0 after an acceptable volume of water has been purged (usually 600ml for peristaltic and 800ml for gas drive), a small change in the value can result in a change greater than the stabilization criteria of 10%. In these situations the sampler can collect the sample before these values have stabilized as long as Specific Conductance and pH are stable.

4.7.4 Collect Sample in Gas Drive Mode

1. Arrange the valves as you would for purging the pump but when the pressure builds do not open the valve on the sampling jig.
2. Remove the sample bottle on the left.
3. Hold the sample vial under the straw for the first vial holder on the sample jig. Slowly open the right valve on the sample jig. Water will flow out of the straw and into the vial. When you have a mounding of water on the top of the vial, shut the valve and cap the vial. Repeat this process for subsequent vials. Check for bubble by inverting the vial

and lightly tapping it on the palm of your hand. If there are bubbles, uncap the vial and fill again.

4. Label the vials appropriately. Note the time of sampling on the field form.
5. Replace the vials with new vials.
6. Prepare to drive as before after adding tubing and rod as necessary by filling and pressurizing the pump. Refer to section 4.6 above for the procedure.

4.8 How to Determine the End of the Profile

There are several ways to determine the end of a profile. Some profiles have a predetermined depth set by the client. The end of the profile is most often determined by the Drive Rate. As the profiler is advanced into the ground the drive rate will decrease as the skin friction of the rod in the ground increases. There are also stratigraphic layers that are more compact than others (clays, tills) that can slow the drive rate. It is important not to drive the profiler once the drive rate gets below 1.5-2 ft per minute for the 1.5 and 1.75-inch rods and 0.5-1.0 ft per min for the 2.25-inch rods. If the rods, tips and drive hardware are hammered on too much they can fatigue and break, crack or bend. The skin friction can also become too great so that the profiling rods cannot be pulled back out of the ground. Consult with the driller / probe operator during profiling to determine when to stop drilling.

It is also possible to drill into bedrock or other subsurface objects (boulders, cobbles, concrete chunks or slabs, etc.). In this case the drive rate can drop very quickly. Stop hammering immediately and discus with the driller and client how to proceed.

Be sure to note on the paper field log as well as the Profile Info tab in the Groundwater Profiling Log how the profile was completed.

4.9 Decontamination

The only decontamination step required between samples in the same hole is to flush the line with analyte free water (distilled or spring water) while driving to the next depth. There are required decontamination procedures for the tip and pump, drill rod, stainless steel tubing and KPRO box that need to be completed at the end of a profile. Some sites and clients may require that all the down-hole tooling be decontaminated using a steam cleaner. If this is the case remove the plates and screens from the tip and take the pump out of the housing so that all of the parts can be cleaned. Usually the drillers will provide the steam cleaner and will clean everything.

4.9.1 Tip and Pump Decontamination

The tip and pump need to be disassembled and cleaned prior to reuse. For the tip, remove the plates and screens. The screws can be reused if they are not rusted or stripped. It may be required to use an impact driver to remove the screws if they are stuck. Rinse out the inside of the tip as well as the screens and plates with Alconox and water to remove all sediment. Scrub the tip and plates with

a firm brush or use a pipe cleaner to lean the inside of the tip. Carefully check the plates to make sure that the sampling ports are clear. Use a pick to remove any sediment from the sampling port holes. Remove and replace the FEP tubing. The piston for the gas drive system can be reused.

For the pump: unthread the tip from the pump housing and unthread the top and bottom housing pieces. Take the pump body out of the housing. Use a brush and bucket of Alconox and water to clean the inside and outside of the housing pieces and pump as well as the springs and plastic bushing. Disassemble the pump body and discard the o-rings, reed valve and Teflon tape. Rinse out the inside of the pump with Alconox and water and then clean water. Check the small o-rings at the narrow end of the pump bottom and replace if necessary.

4.9.2 Drill Rod and Stainless Steel Tubing Decontamination

Upon completion of the sampling and grouting of the hole, the drill rods should be cleaned by steam cleaning, pressure washing or by washing with Alconox and water. It is important to clean the inside, outside and threads of the rod. The stainless steel tubes should have any grout, drilling mud or soil removed from the outside using a steam cleaner, pressure washer or Alconox and water. The inside should be rinsed with analyte free water (distilled or spring water). It is very important that before the stainless steel tubing is reused that it is checked for clogs by using a garden sprayer with an adaptor.

4.9.3 KPRO Box Decontamination and Equipment Blank Procedure

The KPRO box should be decontaminated at the end of each profiling location to make sure that there is no possibility of cross contamination between profiles.

1. The four o-rings located at the top of each bottle holder on the sample jig should be replaced at the completion of the profile. Remove any vials from the sample jig and discard them. Remove the o-rings located at the top of each bottle holder with a straight or slightly angled pick, being careful not to score the threads on the plastic bottle holder. Alconox and water should be squirted up into the top of each bottle holder before the new o-rings are installed.

2. After changing out the o-rings on the sample jig, the box and jig should be flushed out with at least 1L of Alconox and water and 1L of clean water. This can be done in conjunction with the collection of an equipment blank (as required).

3. For peristaltic mode, connect a clean profiling tip to the KPRO box via the harness. Place the tip into a clean vessel containing Alconox and water (the vessel needs only to be as deep as to make sure all of the ports on the tip are submerged). Screw four new vials into the sample jig and arrange the valves on the box to the same orientation for sample collection. Turn on the peristaltic pump. Top off the water in the vessel as the water is pumped through the box. Once you have pumped 1L of Alconox and water, place the profile tip into

a second clean vessel containing only clean, analyte free water and pump 1L of clean water through the box.

4. For gas drive mode, connect all three stainless steel tubes from the pump to the corresponding tubes on the harness and place the tip of the pump in a clean vessel containing Alconox and water. Screw four new vials into the sample jig and arrange the valves on the box to the same orientation for sample collection in peristaltic mode. Disconnect the N2 Out quick connect from the KPRO box. Disconnect the Sample In quick connect and connect it to the N2 Out quick connect and turn on the peristaltic pump. Top off the water in the vessel as the water is pumped through the box. Once you have pumped 1L of Alconox and water, place the profile tip / pump into a second clean vessel containing only clean, analyte free water and pump 1L through the box.
5. If an equipment blank is required, simply collect the required number of voa vials from the sample jig as you would if you were collecting a groundwater sample using the peristaltic mode. If no equipment blank is required, the decontamination process is complete.
6. Record on the paper Groundwater Profile Log that the box has been decontaminated with 1L of Alconox and water and 1L of clean water. Record the date, time and name of the equipment blank (if required).

4.10 Profile Field Data Deliverables

One of the biggest advantages to using the Waterloo ^{APS} is that field data can be quickly processed in the field and given to the client in a matter of minutes. At the end of the profile the raw data needs to be processed so that it can be imported into either Origin to provide a field log to the client or into gINT.

The data should be processed as soon as possible after finishing a profile; either during the decontamination of the KPRO box or during the collection of the first few samples of the following profile. All efforts should be made to get the data to the client by the end of the working day unless otherwise directed. These are the steps:

1. Open the kpro_raw.txt file associated with the profile. Select All (shortcut - Control A) and Copy All (Control C).
2. In the Groundwater Profiling Log Excel workbook, select the Processed Ik tab. Select the top left cell and Paste (Control V) the raw data.
3. This is where alterations or corrections can be made to the data. You can change the depth to water, feet of stainless or other parameters that the software uses to calculate the I_k. If you pulled the profiler up you can delete duplicate data as well.
4. After any corrections are made, scroll to the two far right columns of data; “Corrected Depth to Water” and “New Ik”. Both of these columns have data in the first row only. Highlight

the data cell and double click on the small black square at the bottom right corner of the cell. This will populate the entire column with data. Do this for both columns.

5. Copy the entire New Ik column. Right click on the top row of the Ik column and select Paste Special – Values. This will overwrite the I_k that was generated by the software in real time with a corrected Ik based on any changes that were made to the data. Even if no changes were made to the data this step should be done anyway.

6. Select the Ik Plot tab. Follow the instructions on the screen to plot the Ik data. Carefully check the plot for any errors or bad data. Bad data can be generated a variety of ways and should be deleted from the plot. Examples of bad data are: driving the profiler with the flow off (flow is zero), driving the profiler without starting the software (no data is recorded), not stopping the software after a drive, entering the wrong depth after a drive, etc. If any of these things happen, delete or change the bad data from the Processed Ik tab. Leave a blank row where the data was deleted so that the Ik Plot does not connect the data with a straight line.

   There are other cases where after adding a length of stainless tubing the flow drops so there is a horizontal line on the plot. This data must be shifted up or down to match the previous data. Consult the Data Manager or Project Manager on how to proceed.

7. Open the Origin file named "Physchem_hole_id.opj". This file should be located in the Origin folder in the project directory or in the Forms folder. Save the file to reflect the profile name (Pyschem_WP-01.opj). If you are using gas drive mode and did not collect head measurements, select the file "Physchem_No_Head_hole_id.opj".

8. Select and copy all the data on the Processed Ik tab on the Groundwater Profiling Log. On the Origin file select the Ik record sheet from the bottom of the screen. Select the top left cell and paste the data. It may take a few seconds to paste all of the data.

9. Back on the Groundwater Profiling Log click on the Groundwater Profiling Log tab. Select all the data and paste it into the Physchem sheet in the Origin file.

10. Click on the Layout sheet on the bottom of the Origin file. Check the plots to make sure that the scale is correct and all the data is displayed properly. If the scale needs to be changed select the PhysPlot sheet on the Origin plot and select the axis of the graph you want to change. Select the Scale tab to change the range of values. It is important that all of the plots from a particular site are consistent. Finally, save the file ad a PDF.

11. Provide the client with a copy of the Origin plot by copying the PDF file to a data stick or printing out a hard copy. Double check the Groundwater Profiling Log and make sure that all of the fields on the Groundwater Profiling tab, Profile Info tab and processed Ik tab are completed. At the end of the day email the data (only the Groundwater Profiling Logs and a scan or photo of the field form) to the Project Manager and/or Data Manager and back up the entire project folder to a data stick.

12. Metric Data – There are versions of all of the electronic field logs in metric (either as depth in meters or elevation). There is also a version of the KPRO software that displays the depth in meters but does not record the depth in meters to the kpro_raw file. Before importing the data to the Origin plot it needs to be converted from feet to meters in the Processed Ik tab. To do this insert a blank column to the right of the Corrected Depth column after all of the changes or corrections have been made to the data. In the first cell of the new column create a formula that divides the Corrected Depth by 3.281. (=C2/3.281 where C2 is the cell of the depth you want to convert). Copy this formula to the entire column. Select and copy the entire column and right click on the Corrected Depth column and select Paste Special – Values. Delete the column where the data was copied from.

4.11 Cold Weather Operation

During the winter months when temperatures fall below freezing special precautions need to be taken to protect and successfully operate the Waterloo^{APS} equipment, KPRO box, and associated equipment.

4.11.1 Exposed Stainless Steel Tubing and Rods

While attempting to collect a groundwater samples with below freezing temperatures a cold weather harness may be required. The cold weather harness is a combination of heat tape and pipe insulation wrapped around the stainless steel tubing exiting the KPRO Box. In extreme cold the rod stickup and stainless steel tubing exposed between the cold weather harness and the ground may need to be heated using either a brush-burner or torpedo heater. Flexible duct work can be used to cover the stainless steel and exposed rod to direct the heat from the torpedo heater and to help insulate.

4.11.2 Leaving the site overnight

If freezing conditions will occur overnight the KPRO Box needs to be winterized. The enclosure should be removed and stored where temperatures will not fall below freezing. The KPRO box and cold weather harness should be drained of water:

1. Disconnect the stainless steel tubing harness from the down-hole tubing.
2. Remove the enclosure and replace with a short piece of stainless steel tubing with a female quick connect at each end or leave the enclosure in place.
3. Disconnect the nitrogen “in” (white) KPRO vessel quick connect.
4. Remove the water “out” (black) KPRO vessel quick connect.
5. Turn the regulator dial counter clockwise so that regulator is off. Attach the stainless steel piece that was connected to the “out” (black) quick connect to the low pressure regulator on the nitrogen tank.

6. In the peristaltic pump mode set up the valves on the box as if you were in drive mode and slowly turn the knob on the regulator clockwise slowly until the smallest amount of nitrogen is flowing. If the pressure is too high the flow meter in the enclosure can be damaged. After a few seconds you should see water being pushed out of the harness. After all of the water has been pushed out turn off the nitrogen regulator.

7. In gas drive mode you need to blow out the KPRO box as well as all three of the harness lines. To blow out the nitrogen line, simply turn the 5 way valve to the N2 Out and wait for all of the water to be pushed out of the nitrogen line on the harness. To blow out the sample line (middle tube on the harness), arrange the valves as you would if you were filling the pump. Disconnect the N2 In and KPRO in quick connects ont eh KPRO box. Connect the N2 In to the KPRO In. Slowly turn the knob on the regulator clockwise slowly until the smallest amount of nitrogen is flowing and wait for all of the water to be pushed out of the sample line. To blow out the KPRO line, set up the valves on the box as if you were in drive mode and slowly turn the knob on the regulator clockwise slowly until the smallest amount of nitrogen is flowing. If the pressure is too high the flow meter in the enclosure can be damaged. After a few seconds you should see water being pushed out of the harness. After all of the water has been pushed out turn off the nitrogen regulator.

The KPRO enclosure, KPRO vessel, "out" (black) quick connect, Sonde water quality monitoring system, and calibration solutions should be stored where temperatures will not fall below freezing.

4.12 Other Profiling Configurations

It is possible to set up the KPRO box on a table, cart, tailgate or other surface in order to profile in locations that cannot be accessed with the truck. In instances such as this it may be necessary to power the equipment using a battery. Do not use a standard car battery as repeated draining and charging will diminish its capacity over time. It is better to use a deep cycle RV or similar battery that is designed to power devices and not for starting engines. It is possible to power the KPRO box (including peristaltic pump), field computer and water quality sonde off of a battery for an entire 10 hour day as long as the battery is charged at night. The KPRO box can be connected directly to the battery because it already is 12V. The computer and sonde need to be connected to a DC to AC power inverter that is connected to the battery.

5.0 RESPONSIBILITIES

1. It is the responsibility of the individual employee to read SOPs and document training associated with the area of work they are performing.

2. It is the responsibility of the individual employee to follow SOPs covering activities in his/her work area or to identify a deviation from the written SOP.
3. All personnel will legibly record data and observation to enable others to reconstruct project events and provide sufficient evidence of activities conducted.
4. All personnel will label each page with the date, the signature of the person taking notes (initials may also be appropriate), and the page number. All notes, signatures, and other observations should be entered in the field at the time the notes are taken.
5. SEI field staff should take care to ensure proper data management and integrity of samples.

STONE ENVIRONMENTAL INC

9.0 AUTHORIZATION

Revised by: _____ Date: 1/6/2016

Vincent DeLeone, Waterloo APS Service Leader

Approved by: _____ Date: 6 JAN 2016

Seth Pitkin, Vice President

10.0 REVISION HISTORY

Revision 1:

1. Modified Attachment 1: Groundwater Profiling and K-Pro Testing Equipment Checklist.
2. Modified Attachment 2: Groundwater Profiling Log

Revision 2:

1. ADD trade name APS Advance Profiling System to Waterloo.
2. Under Section 4, changed startup and calibration procedures for the KPRO software to reflect the new KPRO-2006 revision.

Revision 3:

1. Renumbered to take out of laboratory SOP location.
2. Changed and added text
3. Changed the order of steps
4. Replaced photos of valve orientation
5. Deleted old KPRO box photos
6. Added photos of KPRO software
7. Added text for Data Processing
8. Replace KPRO checklist
9. Update Problem Solver
10. Update quick reference Guide
11. Added text and figures about the 2.25" tip and rod

Revision 4:

1. Updated Section 4.1.5 for clarification that water quality sonde's are calibrated or verified weekly rather than daily as these instruments are in-situ.

Revision : 5

1. Updated Section 4.7.1 and 4.7.3 for clarification on stable water quality parameters. There are conditions where stabilization of Dissolved Oxygen and ORP values may not be practical. When Dissolved Oxygen values are less than 1 mg/L and ORP values approach 0 after an acceptable volume of water has been purged (usually 600ml for peristaltic and 800ml for gas drive), a small change in the value can result in a change greater than the stabilization criteria of 10%. In these situations the sampler can collect the sample before these values have stabilized as long as Specific Conductance and pH are stable."

  - _ Sacrificial Tip
  - _ O-rings for Sac Tip
  - _ SS Profiler Screens (4 per tip)
  - _ SS Allen Screws for Screen Plates
- _ 5' x 1.75" Drill Rod (2 X max. anticipated depth)
- _ 2' x 1.75" Drill Rod (1)
- _ Swivel pull
- _ Geoprobe Pull Clamp for 1.75" Rod
- _ Drive Cap (3-4)
- _ Slip Cap (3)
- _ 1/8" SS Tubing
- _ SS Caps for SS Tubing
- _ Extra 1/8" SS Compression Fittings
- _ Stainless steel mesh for tips
  - o 80 X 80
  - o 60 X 60
  - o 100X 100
- _ 1½" Geoprobe X 1¾" Rope crossover (for hooking to grout pump swivel)

KPRO TESTING BOX AND RELATED EQUIPMENT

- _ String Pot
  - _ Com Cable (2)
  - _ Quick Clamp
- _ Compressed N_2 Tank (Large(T) for Gas drive, Small(Q) for peri-sampling)
- _ Dual phase regulator (0-60 psi) for K-pro
- _ Double Pressure Regulator Set (1, 0-60 psi; 1, 0-600 psi), if gas drive
- _ Pressure Vessel (2)
- _ Pressure Vessel quick connects
  - o White-N_2 side (2)
  - o Black-Water side (2)
- _ 1/8" SS Tubing Harness
  - _ 1/8" swage to quick connect (peri/gas) (2+spare)
  - _ 1/8"swage to quick connect (gas drive) (5+spare)
- _ KPRO Box
  - _ Com Cable (2)
  - _ Power Cable (2)
- _ Regulated Power Supply
- _ 1 Liter Graduated Cylinder (plastic)
- _ Field Computer (2)
  - _ Serial Port Card, PCMCIA
  - _ Power Adapter
  - _ CD-Drive
  - _ Floppy Drive
  - _ Extra Battery and Charger
  - _ USB Data Stick
  - _ External Keyboard and Mouse, USB
  - _ USB Hub (optional)
  - _ Field Software CD
  - _ Current Templates
  - _ Blank CD's
- _ Color Printer
  - _ Com Cable (parallel or USB)
  - _ Power Cable
- _ Printer Paper
- _ 5 Gallon Pails for Purge Water/Decon (2)
- _ Water Quality Sonde
  - _ Com Cable
  - _ Flow Cell
  - _ extra D-cell Batteries (Troll)
  - _ power cable (YSI)
  - _ Calibration Standards
  - _ DO membrane maint. kit (Troll)
- _ Field Book/Field Forms

GAS DRIVE PUMP ASSEMBLY

- _ 2.4′ x 1.75″ female – female drill rod (3-4)
- _ male – male pin (bottom) (3-4)
- _ male – female pin (top) (3-4)
- _ Springs (2 per pump)
- _ Nylon Bushing (1 per pump)
- _ Pump Bottom
- _ Pump Body
- _ Pump Top
- _ Reed Valves (bag of 50)
- _ O-rings for Pump Body
- _ O-rings for Pump Bottom
- _ ¼″ SS Tubing (10)
- _ ¼″ NPT male to ¼″ compression fitting
- _ ¼″ Ferrules, SS

PERI MODE TIP ASSEMBLY

- _ FEP Tubing (1/4″ OD X 3/16 ID)
- _ ¼″ NPT male to ¼″ compression fitting
- _ Ferrules, Nylon
- _ Barbed inserts for FEP Tubing, SS (3/16 OD)
- _ ¼″ compression to $^{1}/_{8}$″ compression fitting

SAMPLE COLLECTION

- _ Quatro-rings for Sample Jig
- _ 40mL VOA Vials (Eagle Pitcher) (2-3 cases)
- _ Vial Labels
- _ Silicon tubing for Peri Pump (10 feet)
- _ Coolers and Ice

DECONTAMINATION EQUIPMENT

- _ Alconox
- _ Squirt Bottles
- _ Garden Spray Bottle (3 gallon)
- _ Plastic Sheeting
- _ Contractor Garbage Bags

AUXILIARY EQUIPMENT

- _ Lumber Crayons
- _ 100′ Engineers Tape
- _ Electrical Tape
- _ Ratchet Straps and Bungee Cords
- _ Teflon Tape
- _ Colored Zip Ties
- _ Halogen Work Lights
  - _ Extra Bulb
- _ Chair
- _ Fan (optional)
- _ Padlock with Long Hasp
- _ Coffee Maker
  - _ Green Mountain Coffee French Roast Beans
  - _ Grinder (if whole beans used)
  - _ Filters
  - _ Coffee Cups
- _ Paper Towels
- _ Broom
- _ Ground Fault Circuit Interrupt
- _ Extension Cords
- _ Land line for Circuit panel
- _ Surge Protector

PERSONAL PROTECTIVE EQUIPMENT/SAFETY EQUIPMENT

- _ Nitrile Gloves (2 cases)
- _ Cotton liner Gloves (4-6 pairs)
- _ Leather Work Gloves
- _ Safety Glasses
- _ Hardhats (1 per person + spare)
- _ Hearing Protection

_ Tyvek Suits
_ Emergency Eyewash
_ First Aid Kit
_ Compressed Air Horn
_ Respirator and Cartridges
_ Spill Kit
_ Spare absorbent Pads
_ Fire Extinguisher
_ Flashlight

HAND TOOLS AND POWER EQUIPMENT

_ 7/16" Wrenches (4)
_ Pipe Wrenches, 2, 24"
_ Open Ended Wrenches, Standard, Full Set
_ Screw Drivers, Regular and Phillips
_ Impact Wrench
_ Oil Filter Wrench (suitable to
_ Allen Wrenches, Standard and Metric
_ Crescent Wrench
_ Socket Set, Standard, Full Set
_ 9/16" Socket, Open Ended for removing fittings from Profile Tip
_ Taps for Profiler Tip Screws
_ Tap Handle
_ Torx Bits, T-25
_ Picks, Full Set
_ Pliers, Standard, Needle Nose, and Channel Lock
_ Vise Grips
_ Wire Strippers
_ Electrical Multi-meter
_ Soldering Iron
_ Tin Snips
_ SS Screen Hole Punch
_ Files
_ Utility Knife
_ Extra Blades
_ Tubing Cutter
_ Sledge Hammer, 3lb
_ Butane Lighter
_ Electric Drill
_ Drill Bits, Full Set
_ Carbide Bit for Reaming SS Tubing
_ Angle Grinder

ADDITIONAL WINTER GEAR

_ Pipe Insulation
_ Heat Tape
_ Propane Heaters
_ Kerosene Heaters

SWAGE BOX

_ Ferrules
-1/4" Nylon
-1/8" Stainless Steel
-1/4"Stainless Steel
_ Extra Profiler Tip Plates (4)
_ O-Rings for K-pro Reservoir (large and small)
_ Hose Clamps
_ 1/8" Elbows
-Barb/NPT fittings
-Compression/NPT fittings
_ Spare Pressure Transducer
_ Spare Flow Meter
_ ¼" to ¼" Barb Plastic-NPT
_ ¼" to ¼" Barb Plastic T's
_ 1/4 " in-line Filters
_ Spare 5-way valve
_ Spare 3-way valve
-¼" NPT
-1/8" NPT
_ 1/8" SS tube Caps
_ Extra Regulators
- 100 psi
- 300psi
_ Extra pressure gauge
_ Screws for tip (3/8" #10/32, flathead T-25)
_ Quick disconnect for stainless (4)

DOT REQUIRED EQUIPMENT

_ Driver's Log Notebook
_ Spare Bus Fuses
_ Flares/Reflective Triangles
_ Fire Extinguisher in Cab
_ Windshield Wiper Fluid
_ Flashlight

VEHICLE MAINTENANCE EQUIPMENT

_ Generator Maintenance Log
_ Truck Maintenance Log
_ Owners/Shop Manual (Generator and Truck)
_ Oil Pan
_ Spare Oil (Generator and Truck)
_ Spare Oil Filters (Generator and Truck)
_ Antifreeze
_ Oil Filter Wrench (Generator and Truck)
_ Battery terminal brush
_ Oil Funnel

RENTAL TRUCK GEAR

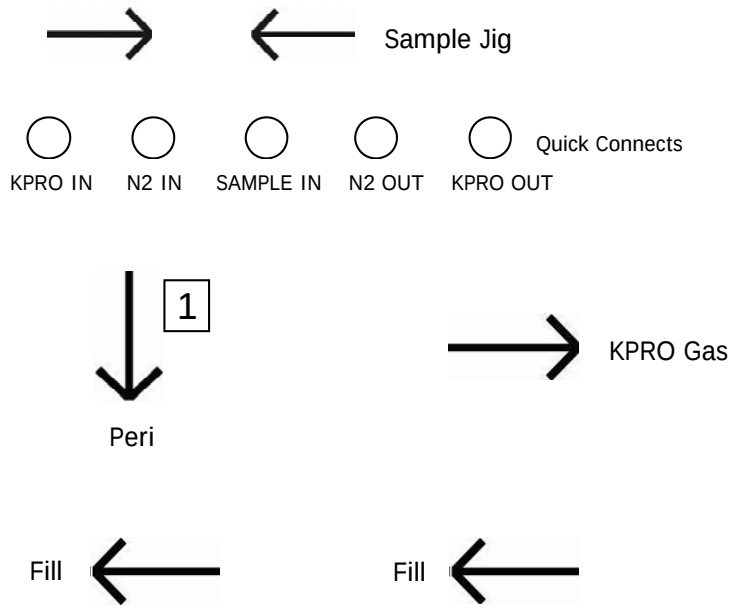
(In addition to the equipment listed above)

ATTACHMENT 2

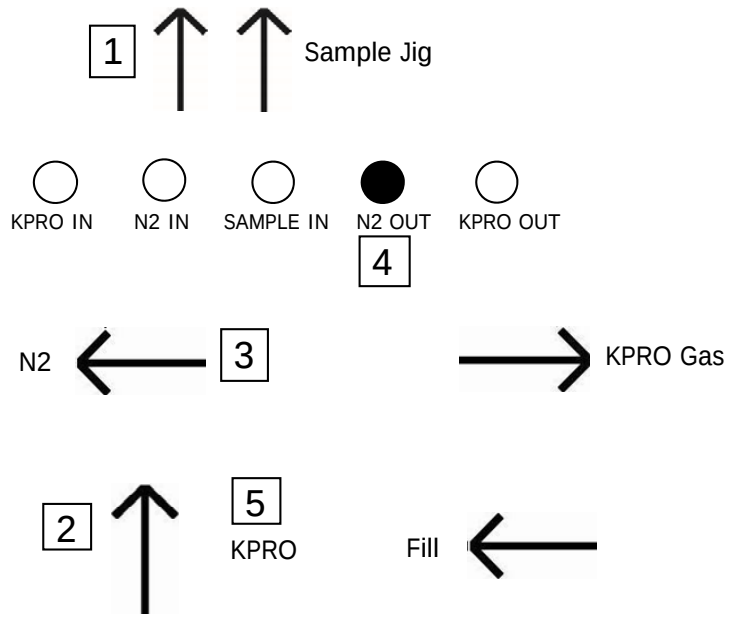
KPRO Quick Reference Guide

Gas Drive Quick Reference Guide

Filling For Drive / Pressure Testing the Pump



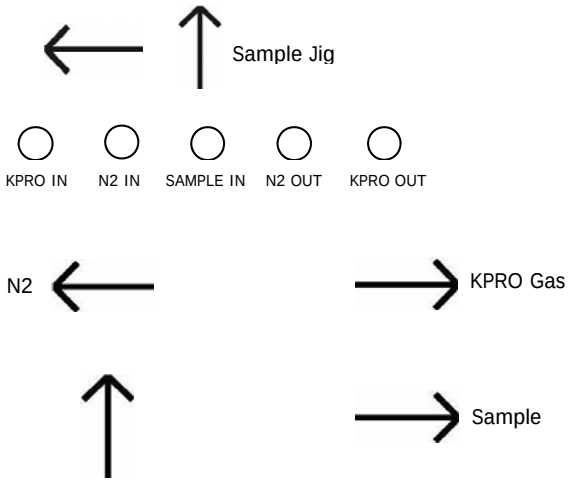
1. Connect the pump to the harness.
2. Arrange the valves as shown. Always turn the 5-way valve clockwise (the top left valve on the bottom, labeled as 1).
3. Make sure that the regulator on the nitrogen tank that supplies the nitrogen to the "N2 IN" is set to the pressure the pump will be used at (to find the pressure, halve the depth, so for 400 feet set the regulator at 200 psi).
4. Turn on the peristaltic pump.
5. The pump is now filling with KPRO water. When the pump is full, you will see water flowing out of the "PERI OUT" tube located at the bottom right hand corner of the KPRO box. This can take several minutes depending on depth. The deeper you are, the longer it will take.
6. Let the water flow out until there are no air bubbles and you get a steady stream.



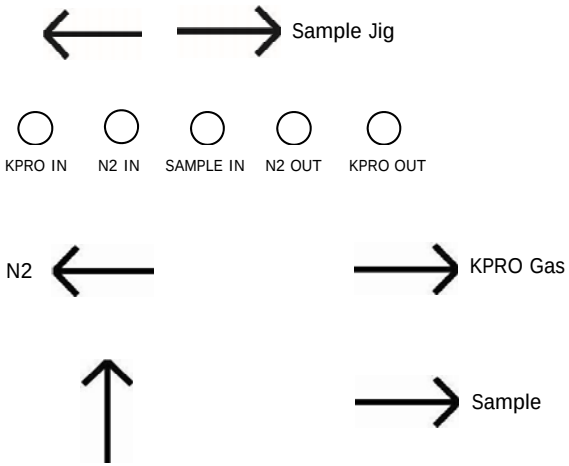
1. Lock off the valves on the sample jig by turning them towards the back (perpendicular to the tubing).
2. Turn off the flow by turning the bottom left valve one quarter turn (which may be to the right or left depending on how the valve was installed.
3. Turn on the nitrogen by turning the top left valve one quarter turn clockwise. You will see the pressure on the gauge rise to the approximate pressure set on the regulator.
4. Disconnect the "N2 OUT" quick connect from the KPRO box. (Second from the right). Observe the pressure gauge. The pressure should drop slightly, then hold. This means that the pump is holding pressure. If the pressure drops significantly then there is a leak. Double check that the fittings connecting the harness to the pump are tight. If this doesn't work, then double check the O-rings and reed valve. If there is still a leak it could be the 5-way valve. Check the Problem Solving Guide for troubleshooting tips./
5. If the pump holds pressure, reconnect the N2 out and turn the flow on by turning the bottom left valve one quarter turn clockwise to "KPRO".

Sampling / Purging The Pump

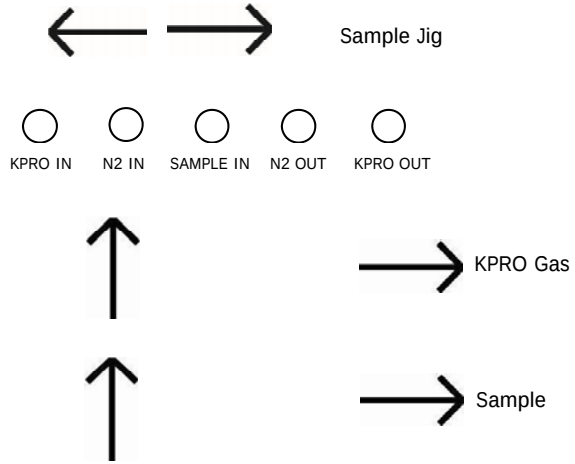
1. After driving to the sample depth and hitting the "Finish" button on the KPRO software, arrange the valves as shown below by turning the left valve on the sample jig to the left and the bottom right valve one half turn clockwise to "Sample". Make sure the Peri pump is on. The Peri pump will help the sample to come in faster at depths up to around 200 feet. Samples deeper do not require the Peri pump to be on.



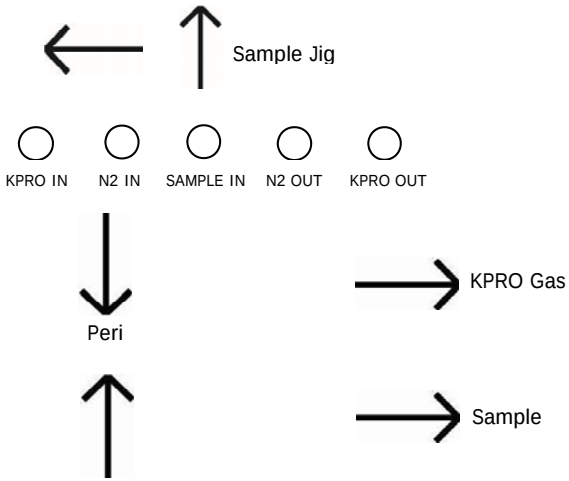
2. Since the pump is already pressurized, turn the right valve on the sample jig so it is facing to the right. This will allow the nitrogen to push the water up from the pump through the sample jig. You should see the VOAs begin to fill. The pressure on the gauge will drop and stabilize.



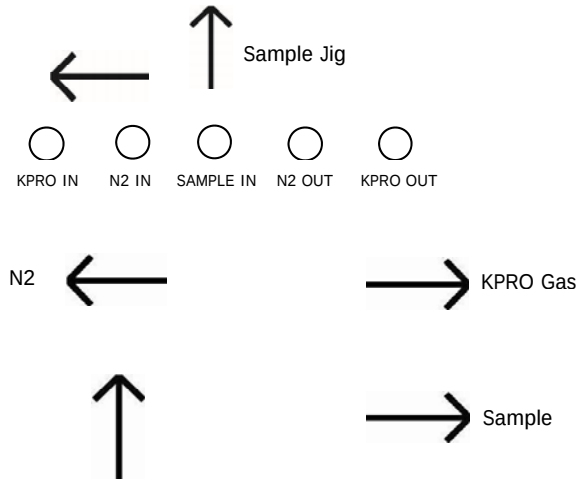
3. Keep a close eye on the pressure gauge. When the pressure gauge starts to move up, turn the top left valve a quarter turn clockwise. This will vent the nitrogen, which will make a hissing sound.



4. After venting the nitrogen, the pressure gauge will drop. When it crosses zero, turn the right valve on the sample jig towards the back (locked off). Wait for all of the gas to vent (the hissing sounds will dissipate) and turn the top left valve one half turn clockwise so it is on "Peri". Record the physchem values.



5. After waiting three minutes (or more or less, depending on how much water was purged during the previous whack) turn the top left valve one quarter turn clockwise to "N2". This will send nitrogen down to pressurize the pump. This is called a "whack". Watch the pressure gauge. When it moves up past zero, turn the right valve on the sample jig to the right. Go back up to step 3 above and follow the sequence.



6. Once the physchem parameters have stabilized and the sample vials have been collected, the pump needs to be filled and pressurized again for driving. Go back up to that section for instructions.

Some notes:
After driving, the stainless steel lines and pump are filled with KPRO water. This water needs to be purged before formation water will appear. To calculate how much KPRO water is in the tubing and pump, multiply the amount of stainless by two, then by 0.8, then add 100. (This accounts for the volume of the tubing going down, coming back up and the pump. There is 0.8 ml per foot of tubing). The first whack should produce almost all of this volume of water.
A good whack should yield 50-60 ml minimum. If you do not get this volume after waiting 3 minutes, wait longer (4 minutes, then 5, etc). If you get more volume than 50-60, do the whacks more often (2 minutes). If you do not get 50-60 ml after waiting 5 or 6 minutes, you may want to drive to a better sampling interval.

If after the first whack you have purged the volume of KPRO that is in the pump and tubing, and after waiting longer between whacks you get nitrogen coming back up instead of water, chances are the sampling interval will not yield a sample. To double check, refill the pump with KPRO water and start the purging/sampling process again.

If you have just added stainless and notice that the flow is a lot lower than it was at the end of the previous drive, you may have a blocked or kinked piece of stainless. Before driving, disconnect the stainless and blow it out with water to make sure all the lines are clear.

Please see the Problem Solving Guide if you have problems that aren't listed here, or if you can't figure it out call the office or somebody to help.

Profiling Problem Solvers Guide

KPRO Trouble Shooting Guide

Version 1.0 Updated 2-26-08 by VLD

Software / Electrical Issues

Symptom	Possible Problem	Solution
Kpro Software Will Not Recognize Box	COM port set incorrectly in Software	There is a text box labeled "Kpro Com Port" on the Kpro software. Make sure that the number matches that of the com port where the Kpro box is plugged in. If it is plugged into the Com port on the back of the computer it is Com 1. If it is plugged into the socket card, click on the socket icon on the toolbar at the bottom right corner of the computer screen to determine which Com ports the computer has assigned to the socket card. A fast way to determine if the box is reading is to start the Kpro software and select "Calibrate" when the dialogue box pops up. Select one of the three choices (Flow, Pressure, String Pot). If the red light in the enclosure comes on and blinks and there are numbers other than zero for the readings, you have a good connection.
	Wiring harness inside Kpro box not connected/ or is loose	Double check that the wiring harness inside the Kpro box is securely connected to the enclosure.
	Computer assigns higher com port for serial card	On the newer tough book laptop computers (Rasc 6,7 and 8), sometimes the socket cards are given Com ports of 9 and or 15 and 16. The Kpro software does not like these higher numbers. Click on the socket card icon at the bottom right corner of the computer screen. Change the com ports of the socket card to Com 2 and 3. If the Kpro box is connected to the socket card, make sure you change the number in the software. If for some reason the socket card will not change the com ports, connect the Kpro box to Com 1 and the water quality sonde to Com 9.
	Bad data cable	After checking all of the above, the data cable may be broken. Double check the connections and maybe try another cable.

	Bad data cable connector	Check the connection plugs on the left-side of the Kpro box. All of the pins should be sticking out about the same distance. If not try using pliers to gently pull out any sunken in pins to the same level as the others. If this is not the case or does not work, if the truck has a spare wiring harness connect that to the enclosure and plug the data and string pot cables directly to it. If there is no spare harness and the truck has another Kpro box, swap out the boxes.
	Computer is not reading the serial card (dual or single)	Insert the serial com card and click on the socket card icon on the lower right corner of the computer screen. If the text box says "no socket card detected" then the driver needs to be installed. On the software disk with each computer there is a socket driver folder with a read me text file in it. Open the text file and follow the instructions.
No power to enclosure	Blown Fuse	The fuses are located inside the top compartment of the enclosure to the right of the LED voltage readout. Remove and inspect the fuses.
	Bad Power cable	Check that the ends of the power cable are securely fastened to the power inverter. If they are and the inverter is on, try replacing the power cable.
	Bad Power inverter	The on/ off switch on the inverter will light up when it is on.
	Broken Enclosure	If after trying all of the above and the enclosure still will not power up, then the enclosure may be broken. You can either swap out the enclosure or the entire Kpro box.
String Pot Malfunction	String pot reads intermittently	Make sure that the connection form the cable to the string pot is tight and that the cable is properly connected to the Kpro box. If they are, try swapping out the cable. If that doesn't work try swapping out the string pot. Also make sure that the wire that extends out of the string pot is not getting hung up on the drill rig or something else (wrench or pulling plug used to weight it down).
	String pot not reading at all	Make sure that the cable is properly connected to the string pot and the box. If there is still no reading, try swapping out the cable and/ or the string pot.
	String pot not reading during drive	Make sure that the string pot is extended before pressing the "Start Kpro" button on the software. If the button is pressed when the string pot is retracted, it will not read.

	String pot reading long/ short	Recalibrate the string pot. If that does not work and the string pot it not off by that much (+/- .5') then correct the depth at the end of the drive or when you stop to collect a sample. If it is off by more than that, try swapping out the string pot, then recalibrate. The string pot slope should be around 1.65 (+/ - 0/2). If it is more or less than that, swap out the cable or string pot.
Flow Meter Issues	Flow seems too high/ or low	Make sure that all of the connections inside the enclosure are tight. Flow out with one piece of stainless attached should be between 170-270. The flow slope should be close to 38 (+/- 2). Recalibrate the flow. If after recalibrating the slope is above or below this, try replacing the flow meter and recalibrating. You can also do a manual check of the flow by timing how long it takes to fill 100ml. If the flow rate matches what the software is reading and it is too high or low, change out the flow meter.
	No flow	Double check that the quick connects that go to the enclosure are connected. Make sure that the bottom left valve is on "Kpro". Check Kpro reservoir for water. In Peri mode, make sure that the top left and right valves are in the "Kpro Peri" position. For gas drive make sure that the top right valve is in "Kpro Gas Drive" position.
	Flow out but flow meter does not read any flow	Make sure that the flow meter is properly connected (electronics cable and plumbing). Make sure that the Kpro software is on and is connected properly. If it is, then replace the flow meter.
Pressure Transducer	Pressure seems too high/ or low	First, make sure that there are no leaks in the enclosure. When checking atmospheric pressure, the pressure should be between 32 and 36. If it is higher or lower, recalibrate the pressure transducer. The pressure slope should be around 22-28. If it is higher or lower than this and the transducer is still reading way off, replace the pressure transducer.
Calibration Problems	KPRO software folder in wrong directory	Make sure that the KPRO_2006 folder is located in the root directory of the C drive (*C:\Kpro_2006). There is an output file that gets written to and if the folder is in the wrong place, the software does not know where to find it.

	Slopes do not change, unrealistic numbers	If the slopes were calibrated with a bad cable, flow meter or pressure transducer, the program can come up with some crazy slopes (-16777 for string pot). The program uses the old slope to calculate the new slope, so it cant create a proper slope based on some crazy unreal number. After replacing the bad component, go to C:\Kpro_2006\Output Files\slopes.txt. Open the file and delete the bad slopes from the file. Make sure that the cursur is at the end of the line with the slopes when you save the file, otherwise the Kpro software will read in from the next line, which is blank, and will give a "NAN" (Not A Number) in place of the slope. Save and close the file, then try calibrating.

Note on calibration: If you calibrate and want to recalibrate right away due to a bad calibration, the program will NOT use the freshly calibrated slopes, but will use the slope that was read in when the program first started. So if you think the newly re-caled slopes are bad, simply recalibrate. If you think that the slopes the program are using are bad, go in and delete the bad slopes from the text file according to the directions above.

KPRO Box Issues

General Peristaltic Pump Problems

Symptom	Possible Problem	Solution
Peri pump not working - no power	Loose connection / bad switch	Make sure that the wiring harness is connected, the power cord is connected, all other connections are good. Some peristaltic pumps are connected to the power supply via a cigarette lighter plug located inside the Kpro box. Make sure that this connection is tight and that there is no corrosion/ and or dirt on the plug. Double check that the connections from the wiring harness to the pump are tight and there is no corrosion on the connectors and switches. If all the connections and switches appear to be fine, then the problem is probably in the wiring harness. In this case you will need to replace the harness or bypass the harness with a spare, or use a different Kpro box.
Pump head will not spin but pump motor is on	Broken spindle	There is a plastic piece inside the pump that has a slot in it that the shaft from the pump head fits into. Over time the slot can get worn and break off. If this happens you need to open up the pump and replace the spindle, or replace the entire pump.

Peristaltic Pump Repair / Replacement		If there is time, remove all the tubing and electrical connections and detach the old pump from the black plastic piece that holds it in the box. Connect the new pump to the black plastic piece and rewire the switches to connect to the switches on the kpro box and reconnect the tubing. A quicker solution is to disconnect the tubing and electrical connection and remove the old peri (black plastic piece and all) and put in the new pump by laying it in the open space in the box and connecting the tubing and electrical. When changing the tubing in the pumps do not tighten the pump head down with a screwdriver, these are meant to be finger tight, using a screwdriver causes the plastic framework within the pump to fatigue and break. None of the fittings for the pump between the black plastic and the switches/pump body are water tight which has lead to corrosion and switch failure. In an effort to extend the life of this equipment using a little silicon sealant at these points is a good idea, if you are working on a box that does not have this please apply a small amount between the 2 parts, any questions please feel free to call me.
Peristaltic Mode		
Cannot pull vacuum	Upper left valve on box not on peri	Should be on "Kpro Peri" during drive, need to switch to "Peri" when pulling sample.
	Worn out silicon tubing	The silicon tubing located inside the head of the pump gets worn and needs to be replaced. Remove the four screws and remove the top half of the head assembly. Replace the silicon with a new piece cut to the same length. Replace the head and only finger tighten the screws.
	Peri pump on reverse	Make sure that the peri pump is going in the right direction. If while the pump is on and there is a positive pressure reading on the gauge, stop the pump, reverse direction and restart the pump.
	Check if problem is in sample jig or other stainless	Turn the valves on the sample jig so that they face one another, therefore bypassing the jig. If the pressure drops and a vacuum is achieved then there is a leak in the sample jig.
	If leak is in sample jig:	
	Loose fittings	Double check that all of the swage fittings on the sample jig are tight.

	Loose Vials / Bad vials	Make sure that the sample vials are tight. They should not be excessively tight. If there is still a leak, replace the vials. Sometimes the threads on the vials can be slightly off and wont fit correctly in the bottle holder.
	No o-rings or bad o-rings	There are special quad o-rings that are located in the bottle holder. Double check that there are o-rings in there and that they are in good condition (not dried out, cracked or cut).
	Sample straw too close to vial bottom	On some of the sample jigs, the straw that extends down into the sample vial is too long and will come in contact with the bottom of the vial. Sometimes this will result in the vial bottom breaking. Other times it will block the straw and water will not be able to pass through. If it looks as if the straw is too long, try inserting an additional o-ring in the bottle holder. If this does not work, file down the straw or cut a small amount off the bottom with a tubing cutter or grinder.
	Plastic bottle holder is worn out / scarified	The threads of the bottle holder can become scarified from people not being careful when removing the o-rings with a pick. If after trying all of the above, the bottle holder may need to be replaced. There are screws located on the under side of the plastic piece (hex screws). Once the holder has been removed, inspect the inside of the threads and if they are scratched and gauged then replace the plastic piece.
	If leak is not in sample jig:	
	Leaky fittings	If it is determined that the leak is not in the sample jig, then you may have a leaky fitting on the harness or down hole. Double check that all the fittings on the Kpro box, harness and stainless are tight.

Gas Drive Mode

Symptom	**Possible Problem**	**Solution**
No inflow of sample water	No Flow during whack. Pressurize pump then open sample jig, but no water flows.	Make sure the bottom right valve is on "sample". Make sure that there are no kinks in the tubing coming out of the box and going to the water quality sonde's flow cell. Also sample straw in jig could be too close to the bottom of the sample vial and is preventing flow. Try loosening the vials to see if you get flow.

Gas bubbles when filling pump for drive	Leaky 5-way valve	If the 5-way valve (the top left valve on the Kpro box) is leaking, nitrogen can leak through. Tighten the valve by first removing the know with a hex wrench. Remove the metal plate. If you see metal shavings, it is possible that the pump has been tightened before and needs to be replace. Insert needle nosed pliers into the two holes on the valve and turn. If the valve still leaks, it needs to be replaced.
Silicon tubing pops off peri pump	Leaky 5-way valve	See above. Another test to determine if the valve is leaking is to pop off the silicon tubing and put your finger over the peri intakes and remove it after a second or two. If you hear a pop, then gas is leaking through the valve. Another way is that with the valve pointed to "Peri", place the vent tubing into some water. If there are bubbles coming out of the tubing, the valve is leaking.
	Replacing 5-way valve	Disconnect the "N2 in" quick connect from the Kpro box. Before removing the valve, take note of which way the fittings are pointing on the under-side of the valve. Is is helpful to make a drawing showing how they are oriented. Remove the knob of the valve with a hex wrench. There is a large nut/ ring on the top-side of the valve that can be removed using a crescent wrench. Disconnect the valve (there are 5 connections). Remove the fittings from the valve, and re-use them if you can. Some of the plastic fittings can become worn out and break, so do not reuse these (there should be new ones in the Swage box). Before installing the fittings on the new valve, wrap the threads with teflon tape. It is much easier to install the fittings onto the valve before putting the valve into the box. Orient the fittings the same way that they were on the old valve, making sure that they are tight. This will make re-installation much easier. It is also easier to re-attach all of the connections before putting the valve through the hole in the plastic and securing the nut/ ring on the top side of the valve.

Profiling Problems

Peristaltic Mode

Symptom	Possible Problem	Solution

Head values seem odd	FEP is broken or disconnected	If you know you are in the water table, and based on previous head readings the head value seems wrong (i.e. a previous head reading was -10, and now it is -1) the FEP tubing could be broken. Slightly pull on the stainless steel tubing coming out of the rods. If you feel resistance, then the tubing is still intact.
	Loose fitting	If the FEP is still intact, there could be a loose fitting that is leaking. To test this, pour water down the rods and watch the pressure reading on the Kpro software. If the pressure rises, there is a leak and the tooling needs to be tripped out and replaced.
	Silty layer	If the profiling tip is in lower-Ik zone, it can take a while for the head value to settle, and it still may settle at a value different than the previous head value (usually a few feet above). Wait a few minutes and record the head value once it stabilizes. Orient the valves and turn on the peri pump to start pulling a sample. If you do not get a sample, the profiler needs to be advanced to a higher Ik zone.
No flow out	Valves in wrong position	Make sure that the valves on the sample jig are pointing towards each other, then that the top left and right valves on the box is pointing towards "Kpro Peri", and that the bottom left valve is turned towards "Kpro".
	Tip is clogged	After attempting to pull a sample, orient the valves for flow and turn on the Kpro. If the flow was good before pumping and is now zero, then the tip became clogged during pumping. Try to advance the profiler, as sometimes the vibration will loosen the soil in the tip and can free it up. If after a few feet there is still no flow, trip out the tooling and replace the tip.
	Kpro reservoir is empty	Make sure there is water in the Kpro reservoir. Disconnect the line going from the nitrogen regulator to the reservoir before opening the top.
Good flow out, no water back	Tip is slightly encased with soil	Develop the formation by alternately flowing Kpro water out the tip and pumping, or by alternating the direction of the peri pump for a few seconds. Make sure to turn the pump off before switching between forward and reverse because it can damage the pump.
	Not deep enough in water table	The profile tip should be at least 6" into the water table.
	Not pulling vacuum	Check previous section listed above
	FEP is broken or disconnected	Check previous section listed above
	Stainless is broken or has sheared off	If the drill rod has broken off it will shear the stainless steel. Pull on the stainless to see if it is still connected.

Pull in very dirty sample	Water from drilling rods is being pulled in	If the sample water is excessively silty and a lot of silt has filled up the sample vials, then there is a chance that the FEP tubing is broken. Check FEP - see above.
Start to get good sample return, then nothing	Tip is clogged	Develop the formation by alternately flowing Kpro water out the tip and pumping, or by alternating the direction of the peri pump for a few seconds. Make sure to turn the pump off before switching between forward and reverse because it can damage the pump.

Gas Drive Mode

Symptom	**Possible Problem**	**Solution**
No flow out tip	Tip is clogged / smeared	The profile tip can become clogged after pulling in a sample that contains fine particles such as silty or fine sand. If after pulling a sample the flow out the tip is lower than before pulling the sample, try advancing the tip a few feet. If during the drive the flow is good but drops off when the hammer is stopped, there is a good chance that the tip is clogged and must be changed. When profiling through a clay layer, it is possible that clay will smear on the tip and cover the sampling ports.
	Kpro line is clogged	See the clogged lines section below
No flow out tip - deep profiling	Rubber inner tube still on tip	When profiling using a drill rig where the drill rods are lowered down into casing filled with drilling mud, it is necessary to put a rubber inner tube over the profile tip to prevent it from clogging. The tip must be advanced at least 1-1.5 feet for the inner tube to be pushed back to expose the sampling ports on the tip.
Cannot fill pump for drive	Nitrogen pressure set to high - reed valve failure	Make sure that the pressure regulator is set at the appropriate pressure for the depth. the conversion is 1 psi = 2.3 feet of water (So for a depth of 200 feet, the regulator should be set around 90 psi, at 500 feet at 220 psi). If the pressure is set to high the reed valve will fail.

	Leaky fitting / reed valve, reed valve silted up	Make sure that the fittings on the harness are tight. The pump will not fill if the reed valve located in the pump is not closing correctly due to silt or a defective valve. Sometimes it is possible to "shock" the reed valve by first making sure that the valves on the sample jig are facing each other, then connecting the "sample out" line to the "N2 out" line and turning the valve on the top right of the box to "N2". This will send nitrogen down the sample line (the sample line inside the pump ends above the reed valve) hopefully mobilizing any silt, or by forcing the valve to close. If this does not work, then the pump needs to be removed from the hole and the reed valve must be replaced.
Cannot pressurize pump	Leaky fitting / reed valve, reed valve silted up / pressure set to high	See above.
		See above.
Pump loses pressure during drive	Leaky fitting / reed valve, reed valve silted up / pressure set to high	See above.
Good flow out, no sample back	Tip is clogged	Sometimes while driving the vibration from the hammer will allow flow out, but when the hammer stops flow will drop. If the flow goes to zero or very low after the hammer is stopped, the tip could be clogged or the formation is tight. You need to either pull out the tooling or drive further.
	Kpro line is loose or came unscrewed	If the flow out is high enough where you think a sample can be pulled but you get no water back when whacking, the Kpro line could be broken of unscrewed. While driving, the tip will become clogged if no water is flowing out. The Kpro water will flow out the open stainless giving the illusion of high Ik. Another clue to this is if you cannot pull a sample and the Ik is high and didn't vary at all over a large depth.
Small sample return (small volume whacks)	Lines are switched	If you are well into the water table and the Ik is high and the whacks are small (less than 50 ml) then the stainless steel lines could be reversed. If there are two lines that are very close in length (usually the sample and nitrogen lines) a short piece of stainless can be added to sample line to separate them.
Sparge sample	Tip is clogged	The pump volume is approximately 120 ml and there is approximately 0.8 ml per foot of stainless. If after purging the appropriate amount of water to fill the pump and stainless the sample sparges, refill the pump, pressurize the pump and turn on

		the Kpro to see if the tip is clogged.
	Ik is too low to sample	Wait longer between whacks. If you purge the volume of the lines and pump and do not see formation water (usually silty) advance the profiler.
	Not venting nitrogen when needle moves	If excess nitrogen gets into the pump the sample will sparge. Be sure to vent the nitrogen as soon as the needle on the gauge tips up. If it sparges, try doing smaller whacks by venting the nitrogen before the needle tips up. If the sparge is too much try refilling the pump and starting over.

Clogged Lines

1. Before attempting to unclog any lines, turn the valves on the sample jig so that they are facing each other, thereby bypassing the sample jig.

2. If you think a line is clogged, the first and fastest thing to check is the harness. The harness can become plugged if it touches the ground while adding stainless. Try disconnecting the harness from the stainless lines and turn on the nitrogen and kpro and see if the lines are clear. You can check the sample line by putting the valves on fill, or plugging the sample line into the kpro out and turning the kpro on.

Determining if a line is clogged

Line	**Problem**	**Solution**
Kpro line	No flow - pump is full and pressurized, flow bottoms out to zero before driving.	Depressurize the pump by venting the nitrogen and turn the valves on the sample jig in. Turn on the Kpro and look at the flow on the Kpro software. Since the pump is de-pressurized and pressure in the pump is less than the pressure outside the tip, Kpro water should flow up into the pump at about 10-20 ml/min. If the flow is still zero, the Kpro line is clogged. See the "Unclogging lines" section below.

Sample Line	Pump does not fill	Turn the left valve on the sample jig so that it faces the wall (closed) if the needle on the pressure gauge does not drop, the line is probably clogged. To double check, plug the sample line into the Kpro out and turn on the Kpro. Watch the flow on the computer. If the flow is zero, then the line is clogged. See the "Unclogging lines" section below.
Nitrogen Line	Pump does not fill	Plug the nitrogen out line into the Kpro out and turn on the Kpro. Watch the flow on the computer. If the flow is zero, then the line is clogged. See the "Unclogging lines" section below.
Unclogging Lines	Kpro Line	1) Isolate zero-headspace sampling apparatus by pointing the two valves handles, located above pressure gauge, inward towards each other. 2) Place “KPRO out” quick connect into “Nitrogen Out” quick connect slot. 3) Turn nitrogen/peri valve to “Gas Drive” position, which will allow nitrogen flow down the KPRO line and out into the formation. 4) Listen to gas drive regulator to determine if regulator stops delivering flow, as indicated by the regulator becoming silent. If regulator continues to make “hissing noise”, then the KPRO line is free of any obstructions. 5) If the obstruction cannot be removed via the nitrogen pressure, the tool must be removed from the ground and inspected to determine where the clog is present.
	Nitrogen Line and Sample Line	1) Isolate zero-headspace sampling apparatus by pointing the two valves handles, located above pressure gauge, inward towards each other. 2) Turn nitrogen/peri valve to “Gas Drive” position and disconnect the sample line from where it enters the pressure gauge. This will allow nitrogen flow down the nitrogen line and up the sample line. 3) Listen to gas drive regulator to determine if regulator stops delivering flow, as indicated by the regulator becoming silent. If regulator continues to make a “hissing noise” and nitrogen flow is observed at the effluent of the sample line, then the nitrogen line, the gas drive pump and the sample line are free of any clogs. If regulator stops delivering flow, as indicated by the regulator becoming silent, then either the sample line, the nitrogen line, or the

		gas drive pump may be clogged.
		4) If the obstruction cannot be removed via the nitrogen pressure, the tool must be removed from the ground and inspected to determine where the clog is present.

Water Quality Sondes

Symptom	Possible Problem	Solution
Sonde is not recognized by the computer	Wrong Com Port in Software	Make sure that the com port assigned in the software is the same one that the sonde is connected to. Most of the software will only go up to Com 9.
	Power not connected/ batteries are dead	The YSI and Hach sondes have a power supply. The Trolls have batteries. To change the batteries first unscrew/ disconnect the data cable and then unscrew the top of the sonde.
	Cable is broken	If after trying the first two steps listed above there is still no connection between the sonde and the computer, the data cable connecting the sonde to the computer could be faulty. Try a different cable.
Water quality parameter values are way off	Computer/ Sonde needs to be restarted or recalibrated.	Sometimes the sondes can read strange numbers (i.e. pH of 100, DO of 300). The first thing to try is to restart the computer. If this does not work try recalibrating the sonde. It is better to calibrate/ check each probe individually rather than using an all in one cal solution (such as Quick Cal). If the sonde is still off, look below.
	Individual probes need to be changed.	From time to time the individual probes on the sondes can be faulty. Each troll/ YSI case should have extra probes. Swap out the probe and check/ and or recalibrate. Make sure when checking/ calibrating that the probes are fully immersed in the cal solution. Also, it is very important to store the probes in the correct manner. Never store the probes dry, even overnight. At the end of the day, take the sonde out of the flow cell and store it in the screw on cap filled with pH 4 solution For long term storage (longer than a week) remove the individual probes and store them in the appropriate solution (check the manual for the particular sondes for the correct way to do this).

	Bad Cal Solutions	Calibration solutions can go bad if they have been opened for a while (especially conductivity). Always write the date opened on any bottle of solution when it is opened for the first time. If you think they solution may be old, recheck or calibrate with fresh solution.
	Water Temperature - DO calibration	When calibrating or checking the DO using the water saturated air method, make sure that the water you are using is relatively warm. If you are checking the sonde first thing on a cold morning with water that was in the truck, it will take longer for the water to vaporize in the flow cell and therefore the calibration will take longer or won't happen at all. Try heating the water in a cup using a space heater prior to calibration. Make sure to record the DO value and temperature in the log book for the sonde after calibration or check.
Values do not change	Clogged flow cell - silted up probes	Make sure that the sonde is kept vertical, otherwise sediment can build up in the flow cell and coat the probes.

Calibration Notes for Hach Hydrolab

1. There is a reference solution for the PH/ORP probe that needs to be changed monthly (not sure if that is only in use or always) it is very easy to do following the instructions in the manual.

2. When you calibrate the PH on these units it is IMPORTANT to calibrate the PH 7 standard first followed by either the 4 or 10 or both as the calibration method uses the 7 as zero and calculates the slope with the 4/10.

Torpedo/ Salimander Heaters

********** UNPLUG THE HEATER WHEN YOU ARE TROUBLESHOOTING IT EXCEPT IN AN ATTEMPT TO START IT************

Symptom	Possible Problem	Solution
Unit will not start / shuts off	Not plugged in / no power Fuel	1. Make sure the unit has Power. 2. Check your fuel source for diesel treatment; they do not fire quite the same as a diesel engine and the treatment in the fuel may not be working for the heater. Possible solutions include more additive, a different additive and using kerosene.

Starter element is bad	3. Look inside the unit (FROM THE REAR) as it tries to start, if there is not a red glow inside then the element must be replaced, parts available at Home Depot.
Air filter is plugged / clogged.	4. Check the air filter on the back of the unit: This can become iced up or plugged with dust/dirt. Clean it!
Fuel filter	5. If the temperature isn't far below freezing and the fuel is not in question you may try replacing the fuel filter. This can be found by removing the control panel (2 Philips screws above the controls) it is a white inverted cone with a black tube attached to it sticking out of the fuel tank. To remove the filter you most pull out the rubber bushing it sits in; failure to do this will remove the fuel pickup tube from the bottom of the filter and cause the unit to only be able to utilize 10% of the fuel tank capacity (the first 10) replacement filters can be purchased at Home Depot.
Fuel line	6. Check the fuel pickup line mentioned above.

Other issues:

1. If the unit runs for a while then shuts off repeatedly it is likely 2 or 6 above.
2. Sometimes the unit will start with the top cover off and not with it on, I have come across this while troubleshooting and it is the result of improper fuel supply pressure, this can be corrected with the pressure gauge from the manufacturer but they are too costly to have in every truck. For a temporary solution you can restrict the airflow from the back with a piece of cardboard to get it to fire then remove the cardboard for operation, doing so will cause the fuel supply to spread further and interact properly with the igniter.
3. They get very hot, allow them to cool after use before placing them in a truck.
4. While in operation they are a serious hazard and must be used in such a manner as to not melt nearby objects (people, drill rigs etc.) keep in mind that the heat from these is dangerous for more than 10 feet.
5. Do not fuel them while in use.
6. Do not fuel them to the very top, the caps have a vent that will leak if not perfectly level.

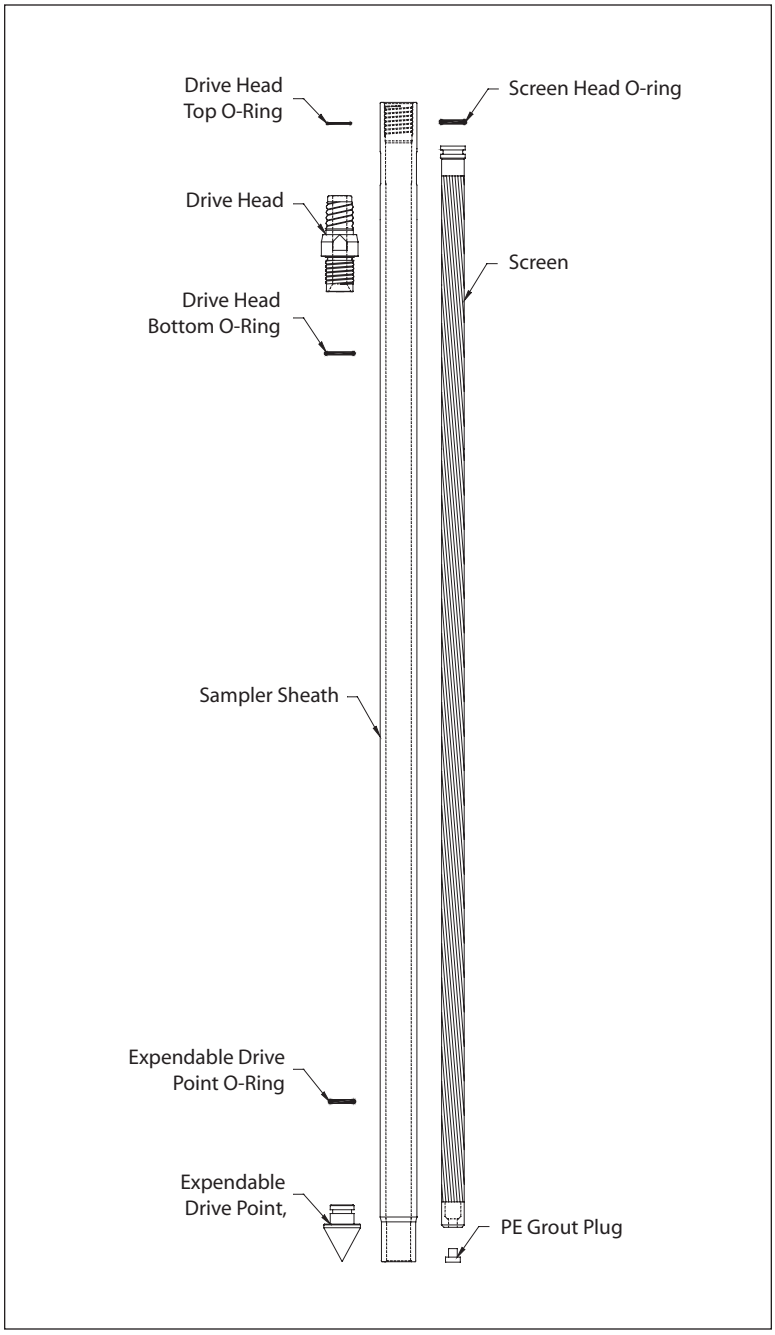
DO NOT USE GASOLINE IN THEM !!!

GEOPROBE® SCREEN POINT 16 GROUNDWATER SAMPLER

STANDARD OPERATING PROCEDURE

Technical Bulletin No. MK3142

PREPARED: November, 2006



GEOPROBE® SCREEN POINT 16 GROUNDWATER SAMPLER PARTS

Geoprobe® and Geoprobe Systems®, Macro-Core® and Direct Image® are Registered Trademarks of Kejr, Inc., Salina, Kansas

Screen Point 16 Groundwater Sampler is manufactured under U.S. Patent 5,612,498

1.0 OBJECTIVE

The objective of this procedure is to drive a sealed stainless steel or PVC screen to depth, deploy the screen, obtain a representative water sample from the screen interval, and grout the probe hole during abandonment. The Screen Point 16 Groundwater Sampler enables the operator to conduct abandonment grouting that meets American Society for Testing and Materials (ASTM) Method D 5299 requirements for decommissioning wells and borings for environmental activities (ASTM 1993).

2.0 BACKGROUND

2.1 Definitions

Geoprobe®: A brand name of high quality, hydraulically powered machines that utilize both static force and percussion to advance sampling and logging tools into the subsurface. The Geoprobe® brand name refers to both machines and tools manufactured by Geoprobe Systems®, Salina, Kansas. Geoprobe® tools are used to perform soil core and soil gas sampling, groundwater sampling and monitoring, soil conductivity and contaminant logging, grouting, and materials injection.

Screen Point 16 (SP16) Groundwater Sampler: A direct push device consisting of a PVC or stainless steel screen that is driven to depth within a sealed, steel sheath and then deployed for the collection of representative groundwater samples. The assembled SP16 Sampler is approximately 51.5 inches (1308 mm) long with an OD of 1.625 inches (41 mm). Upon deployment, up to 41 inches (1041 mm) of screen can be exposed to the formation. The Screen Point 16 Groundwater Sampler is designed for use with 1.5-inch probe rods and machines equipped with the more powerful GH60 Hydraulic Hammer. Operators with GH40 Series hammers may chose to use this sampler in soils where driving is difficult.

Rod Grip Pull System: An attachment mounted on the hydraulic hammer of a direct push machine which makes it possible to retract the tool string with extension rods or flexible tubing protruding from the top of the probe rods. The Rod Grip Pull System includes a pull block with rod grip jaws that are bolted directly to the machine. A removable handle assembly straddles the tool string while hooking onto the pull block to effectively grip the probe rods as the hammer is raised. A separate handle assembly is required for each probe rod diameter.

2.2 Discussion

In this procedure, the assembled Screen Point 16 Groundwater Sampler (Fig. 2.1A) is threaded onto the leading end of a Geoprobe® probe rod and advanced into the subsurface with a Geoprobe® direct push machine. Additional probe rods are added incrementally and advanced until the desired sampling interval is reached. While the sampler is advanced to depth, O-ring seals at each rod joint, the drive head, and the expendable drive point provide a watertight system. This system eliminates the threat of formation fluids entering the screen before deployment and assures sample integrity.

Once at the desired sampling interval, extension rods are sent downhole until the leading rod contacts the bottom of the sampler screen. The tool string is then retracted approximately 44 inches (1118 mm) while the screen is held in place with the extension rods (Fig. 2.1B). As the tool string is retracted, the expendable point is released from the sampler sheath. The tool string and sheath may be retracted the full length of the screen or as little as a few inches if a small sampling interval is desired.

There are three types of screens that can be used in the Screen Point 16 Groundwater Sampler. Two of the these, a stainless steel screen with a standard slot size of 0.004 inches (0.10 mm) and a PVC screen with a standard slot size of 0.010 inches (0.25 mm), are recovered with the tool string after sampling. The third screen is also manufactured from PVC with a standard slot size of 0.010 inches (0.25 mm), but is designed to be left downhole when sampling is complete. This disposable screen has an exposed screen length of approximately 43 inches (1092 mm). The two screens that are recovered with the sampler both have an exposed screen length of approximately 41 inches (1041 mm).

(continued on following page)

An O-ring on the head of the stainless steel screens maintains a seal at the top of the screen. As a result, any liquid entering the sampler during screen deployment must first pass through the screen. PVC screens do not require an O-ring because the tolerance between the screen head and sampler sheath is near that of the screen slot size.

The screens are constructed such that flexible tubing, a mini-bailer, or a small-diameter bladder pump can be inserted into the screen cavity. This makes direct sampling possible from anywhere within the saturated zone. A removable plug in the lower end of the screens allows the user to grout as the sampler is extracted for further use.

Groundwater samples can be obtained in a number of ways. A common method utilizes polyethylene (TB25L) or Teflon® (TB25T) tubing and a Check Valve Assembly (GW4210). The check valve (with check ball) is attached to one end of the tubing and inserted down the casing until it is immersed in groundwater. Water is pumped through the tubing and to the ground surface by oscillating the tubing up and down.

An alternative means of collecting groundwater samples is to attach a peristaltic or vacuum pump to the tubing. This method is limited in that water can be pumped to the surface from a maximum depth of approximately 26 feet (8 m). Another technique for groundwater sampling is to use a stainless steel Mini-Bailer Assembly (GW41). The mini-bailer is lowered down the inside of the casing below the water level where it fills with water and is then retrieved from the casing.

The latest option for collecting groundwater from the SP16 sampler is to utilize a Geoprobe® MB470 Series Mechanical Bladder Pump (MBP)*. The MBP may be used to meet requirements of the low-flow sampling protocol (Puls and Barcelona 1996, ASTM 2003). Through participation in a U.S. EPA Environmental Technology Verification study, it was confirmed that the MB470 can provide representative samples (EPA 2003).

**The Mechanical Bladder Pump is manufactured under U.S. Patent No. 6,877,965 issued April 12, 2005.*

Screen Point 16 Groundwater Sampler

3.0 TOOLS AND EQUIPMENT

The following tools and equipment can be used to successfully recover representative groundwater samples with the Geoprobe® Screen Point 16 Groundwater Sampler. Refer to Figures 3.1 and 3.2 for identification of the specified parts. Tools are listed below for the most common SP16 / 1.5-inch probe rod configurations. Additional parts for optional rod sizes and accessories are listed in Appendix A.

SP16 Sampler Parts	**Part Number**
SP16 Sampler Sheath	15187
SP16 Drive Head, 0.5-inch bore, 1.5-inch rods*	18307
SP16 O-ring Service Kit, 1.5-inch rods *(includes 4 each of the O-ring packets below)*	15844
O-rings for Top of SP16 Drive Head, 1.5-inch rods only (Pkt. of 25)	*15389*
O-rings for Bottom of SP16 Drive Head (Pkt. of 25)	*13196*
O-rings for GW1520 Screen Head (Pkt. of 25)	*GW1520R*
O-rings for SP16 Expendable Drive Point (Pkt. of 25)	*GW1555R*
Screen, Wire-Wound Stainless Steel, 4-Slot*	GW1520
Grout Plugs, PE (Pkg. of 25)	GW1552K
Expendable Drive Points, steel, 1.625-inch OD (Pkg. of 25)*	GW1555K
Screen Point 16 Groundwater Sampler Kit, 1.5-inch Probe Rods *(includes 1 each of: 15187, 18307, 15844, GW1520, GW1535, GW1540, GW1555K, and GW1552K)*	15770

Probe Rods and Probe Rod Accessories	**Part Number**
Drive Cap, 1.5-inch probe rods, threadless, (for GH60 Hammer)	12787
Pull Cap, 1.5-inch probe rods	15090
Probe Rod, 1.5-inch x 60-inch*	11121

Extension Rods and Extension Rod Accessories	**Part Number**
Screen Push Adapter	GW1535
Grout Plug Push Adapter	GW1540
Extension Rod, 60-inch*	10073
Extension Rod Coupler	AT68
Extension Rod Handle	AT69
Extension Rod Jig	AT690
Extension Rod Quick Link Coupler, pin	AT695
Extension Rod Quick Link Coupler, box	AT696

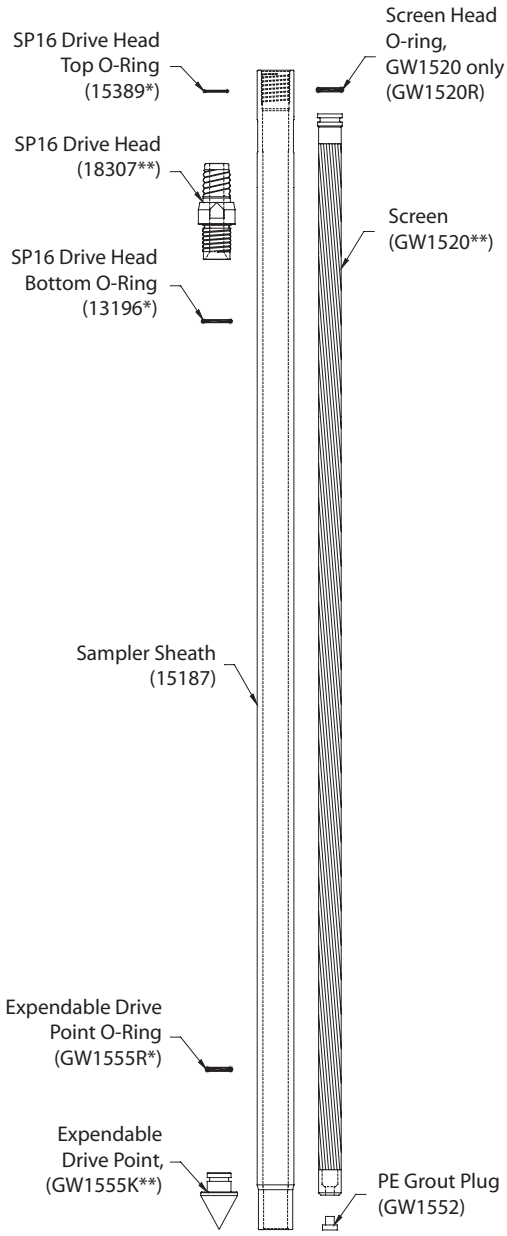
Grout Accessories	**Part Number**
Grout Nozzle, for 0.375-inch OD tubing	GW1545
High-Pressure Nylon Tubing, 0.375-inch OD / 0.25-inch ID, 100-ft. (30 m)	11633
Grout Machine, self-contained*	GS1000
Grout System Accessories Package, 1.5-inch rods	GS1015

Groundwater Purging and Sampling Accessories	**Part Number**
Polyethylene Tubing, 0.375-inch OD, 500 ft.*	TB25L
Check Valve Assembly, 0.375-inch OD Tubing*	GW4210
Water Level Meter, 0.438-inch OD Probe, 100 ft. cable*	GW2000
Mechanical Bladder Pump**	MB470
Mini Bailer Assembly, stainless steel	GW41

Additional Tools	**Part Number**
Adjustable Wrench, 6.0-inch	FA200
Adjustable Wrench, 10.0-inch	FA201
Pipe Wrenches	NA

* See Appendix A for additional tooling options.

** Refer to the Standard Operating Procedure (SOP) for the Mechanical Bladder Pump (Technical Bulletin No. MK3013) for additional tooling needs.



* Included in the SP16 O-ring Service Kit (15844)
** Part numbers show most common tool configuration. See Appendix A for alternative parts.

FIGURE 3.1
SP16 Sampler Parts

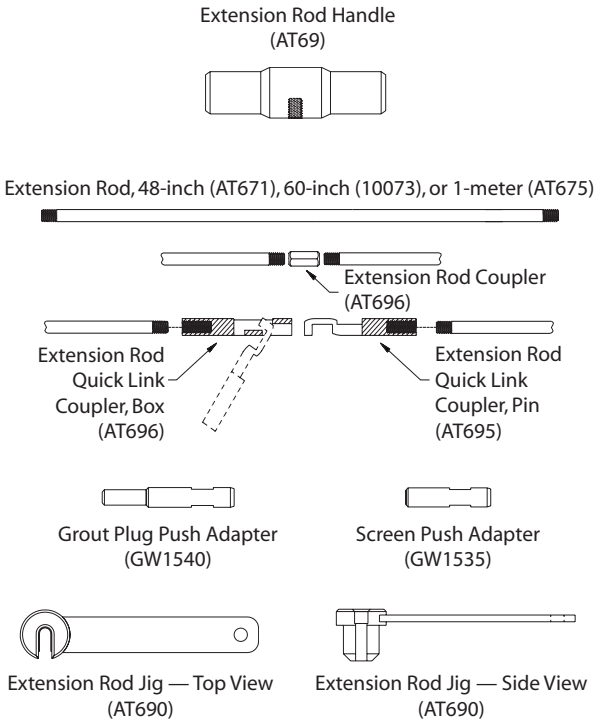


FIGURE 3.2
Geoprobe® Extension Rods and Accessories

4.0 OPERATION

4.1 Basic Operation

The SP16 sampler utilize a stainless steel or PVC screen which is encased in an alloy steel sampler sheath. An expendable drive point is placed in the lower end of the sheath while a drive head is attached to the top. O-rings on the drive head and expendable point provide a watertight sheath which keeps contaminants out of the system as the sampler is driven to depth.

Once the sampling interval is reached, extension rods equipped with a screen push adapter are inserted down the ID of the probe rods. The tool string is then retracted up to 44 inches (1118 mm) while the screen is held in place with the extension rods. The system is now ready for groundwater sampling. When sampling is complete, a removable plug in the bottom of the screen allows for grouting below the sampler as the tool string is retrieved.

4.2 Sampler Options

The Screen Point 15 and Screen Point 16 Groundwater Samplers are nearly identical. Subtle differences in the design of the SP16 sampler make it more durable than the earlier SP15 system. Operators of GH60-equipped machines should always utilize SP16 tooling. Operators of machines equipped with GH40 Series hammers may also choose SP16 tooling when sampling in difficult probing conditions.

A 1.75-inch OD Expendable Drive Point (17066K) and Disposable PVC Screen (16089) provide two useful options for the SP16 sampler. The 1.75-inch drive point may be used when soil conditions make it difficult to remove the sampler after driving to depth. The disposable PVC screen may be left downhole after sampling (when regulations permit) to eliminate the time required for screen decontamination.

4.3 Decontamination

In order to collect representative groundwater samples, all sampler parts must be thoroughly cleaned before and after each use. Scrub all metal parts using a stiff brush and a nonphosphate soap solution. Steam cleaning may be substituted for hand-washing if available. Rinse with distilled water and allow to air-dry before assembly.

4.4 SP16 Sampler Assembly (Figure 4.1)

Part numbers are listed for a standard SP16 sampler using 1.5-inch probe rods. Refer to Page 6 for screen and drive head alternatives.

1. Place an O-ring on a steel expendable drive point (GW1555K). Firmly seat the expendable point in the necked end of a sampler sheath (15187).

2. Install a PE Grout Plug (GW1552) in the bottom end of a Wire-wound Stainless Steel Screen (GW1520). Place a GW1520R O-ring in the groove on the top end of the screen.

3. Slide the screen inside of the sampler sheath with the grout plug toward the bottom of the sampler. Ensure that the expendable point was not displaced by the screen.

4. Install a bottom O-ring (13196) on a Drive Head (18307 or 15188). Thread the drive head into the sampler sheath using an adjustable wrench if necessary to ensure complete engagement of the threads. Attach a Drive Cap (12787 or 15590) to the top of the drive head.

   NOTE: The 18307 drive head should be used whenever possible as the smaller 0.5-inch ID provides a greater material cross-section for increased durability.

Sampler assembly is complete.

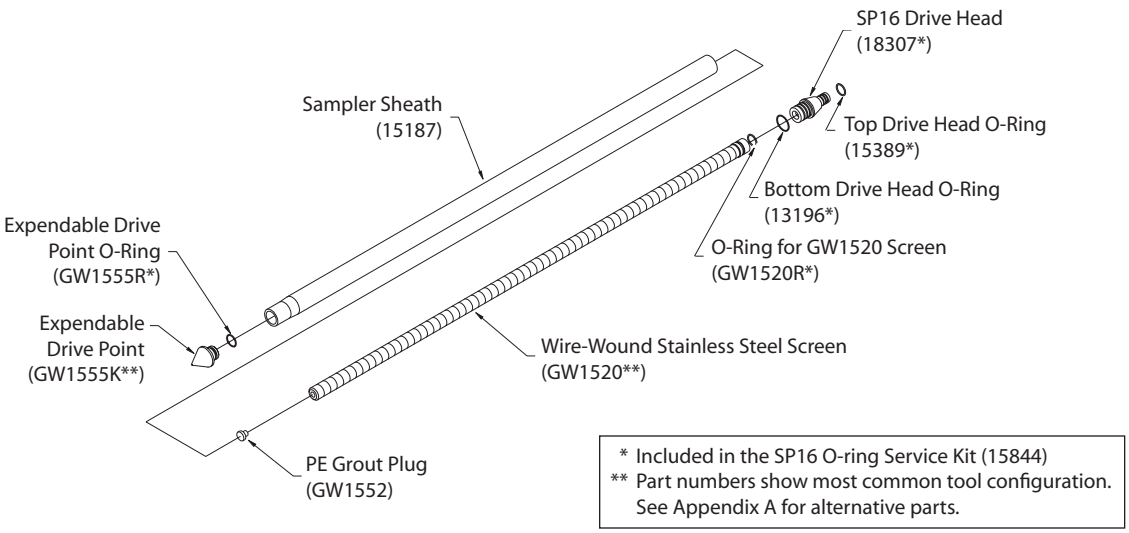

FIGURE 4.1
Screen Point 16 Groundwater Sampler Assembly

4.5 Advancing the SP16 Sampler

To provide adequate room for screen deployment with the Rod Grip Pull System, the probe derrick should be extended a little over halfway out of the carrier vehicle when positioning for operation.

1. Begin by placing the assembled sampler (Fig. 2.1.A) in the driving position beneath the hydraulic hammer of the direct push machine as shown in Figure 4.2.

2. Advance the sampler with the throttle control at slow speed for the first few feet to ensure that the sampler is aligned properly. Switch to fast speed for the remainder of the probe stroke.

3. Completely raise the hammer assembly. Remove the drive cap and place an O-ring in the top groove of the drive head. Distilled water may be used to lubricate the O-ring if needed.

Add a probe rod (length to be determined by operator) and reattach the drive cap to the rod string. Drive the sampler the entire length of the new rod with the throttle control at fast speed.

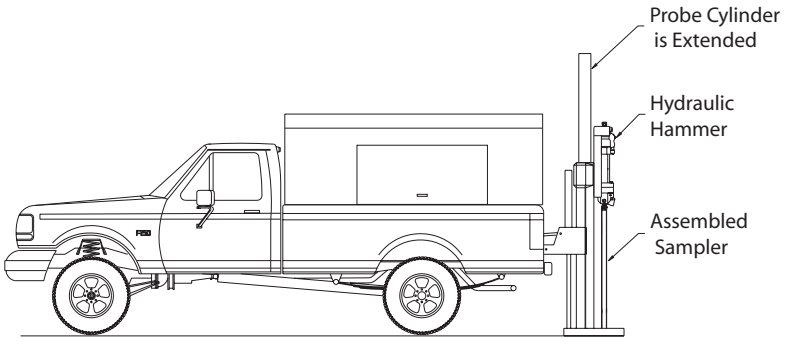

FIGURE 4.2
Screen Point 16 Groundwater Sampler in Driving Position

4. Repeat Step 3 until the desired sampling interval is reached. Approximately 12 inches (305 mm) of the last probe rod must extend above the ground surface to allow attachment of the puller assembly. A 12-inch (305 mm) rod may be added if the tool string is over-driven.

5. Remove the drive cap and retract the probe derrick away from the tool string.

4.6 Screen Deployment

1. Thread a screen push adapter (GW1535) on an extension rod of suitable length (AT671, 10073, or AT675). Attach a threaded coupler (AT68) to the other end of the extension rod. Lower the extension rod inside of the probe rod taking care not to drop it down the tool string. An extension rod jig (AT690) may be used to hold the rods.

2. Add extension rods until the adapter contacts the bottom of the screen. To speed up this step, it is recommended that Extension Rod Quick Links (AT695 and AT696) are used at every other rod joint.

3. Ensure that at least 48 inches (1219 mm) of extension rod protrudes from the probe rod. Thread an extension rod handle (AT69) on the top extension rod.

4. Maneuver the probe assembly into position for pulling.

5. Raise (pull) the tool string while physically holding the screen in place with the extension rods (Fig. 4.3.B). A slight knock with the extension rod string will help to dislodge the expendable point and start the screen moving inside the sheath.

   Raise the hammer and tool string about 44 inches (1118 cm) if using a GW1520 or GW1530 screen. At this point the screen head will contact the necked portion of the sampler sheath (Fig. 4.3.C.) and the extension rods will rise with the probe rods. Use care when deploying a PVC screen so as not to break the screen when it contacts the bottom of the sampler sheath.

   The Disposable Screen (16089) will extend completely out of the sheath if the tool string is raised more than 45 inches (1143 mm). Measure and mark this distance on the top extension rod to avoid losing the screen during deployment.

6. Remove the rod grip handle, lower the hammer assembly, and retract the probe derrick. Remove the top extension rod (with handle) and top probe rod. Finally, extract all extension rods.

7. Groundwater samples can now be collected with a mini-bailer, peristaltic or vacuum pump, tubing bottom check valve assembly, bladder pump, or other acceptable small diameter sampling device.

   When inserting tubing or a bladder pump down the rod string, ensure that it enters the screen interval. The leading end of the tubing or bladder pump will sometimes catch at the screen head giving the illusion that the bottom of the screen has been reached. An up-and-down motion combined with rotation helps move the tubing or bladder pump past the lip and into the screen.

4.7 Abandonment Grouting for GW1520 and GW1530 Screens

The SP16 Sampler can meet ASTM D 5299 requirements for abandoning environmental wells or borings when grouting is conducted properly. A removable grout plug makes it possible to deploy tubing through the bottom of GW1520 and GW1530 screens. A GS500 or GS1000 Grout Machine is then used to pump grout into the open probe hole as the sampler is withdrawn. The following procedure is presented as an example only and should be modified to satisfy local abandonment grouting regulations.

1. Maneuver the probe assembly into position for pulling. Attach the rod grip puller to the top probe rod. Raise the tool string approximately 4 to 6 inches (102 to 152 cm) to allow removal of the grout plug.

2. Thread the Grout Plug Push Adapter (GW1540) onto an extension rod. Insert the adapter and extension rod inside the probe rod string. Add extension rods until the adapter contacts the grout plug at the bottom of the screen. Attach the handle to the top extension rod. When the extension rods are slightly raised and lowered, a relatively soft rebound should be felt as the adapter contacts the grout plug. This is especially true when using a PVC screen.

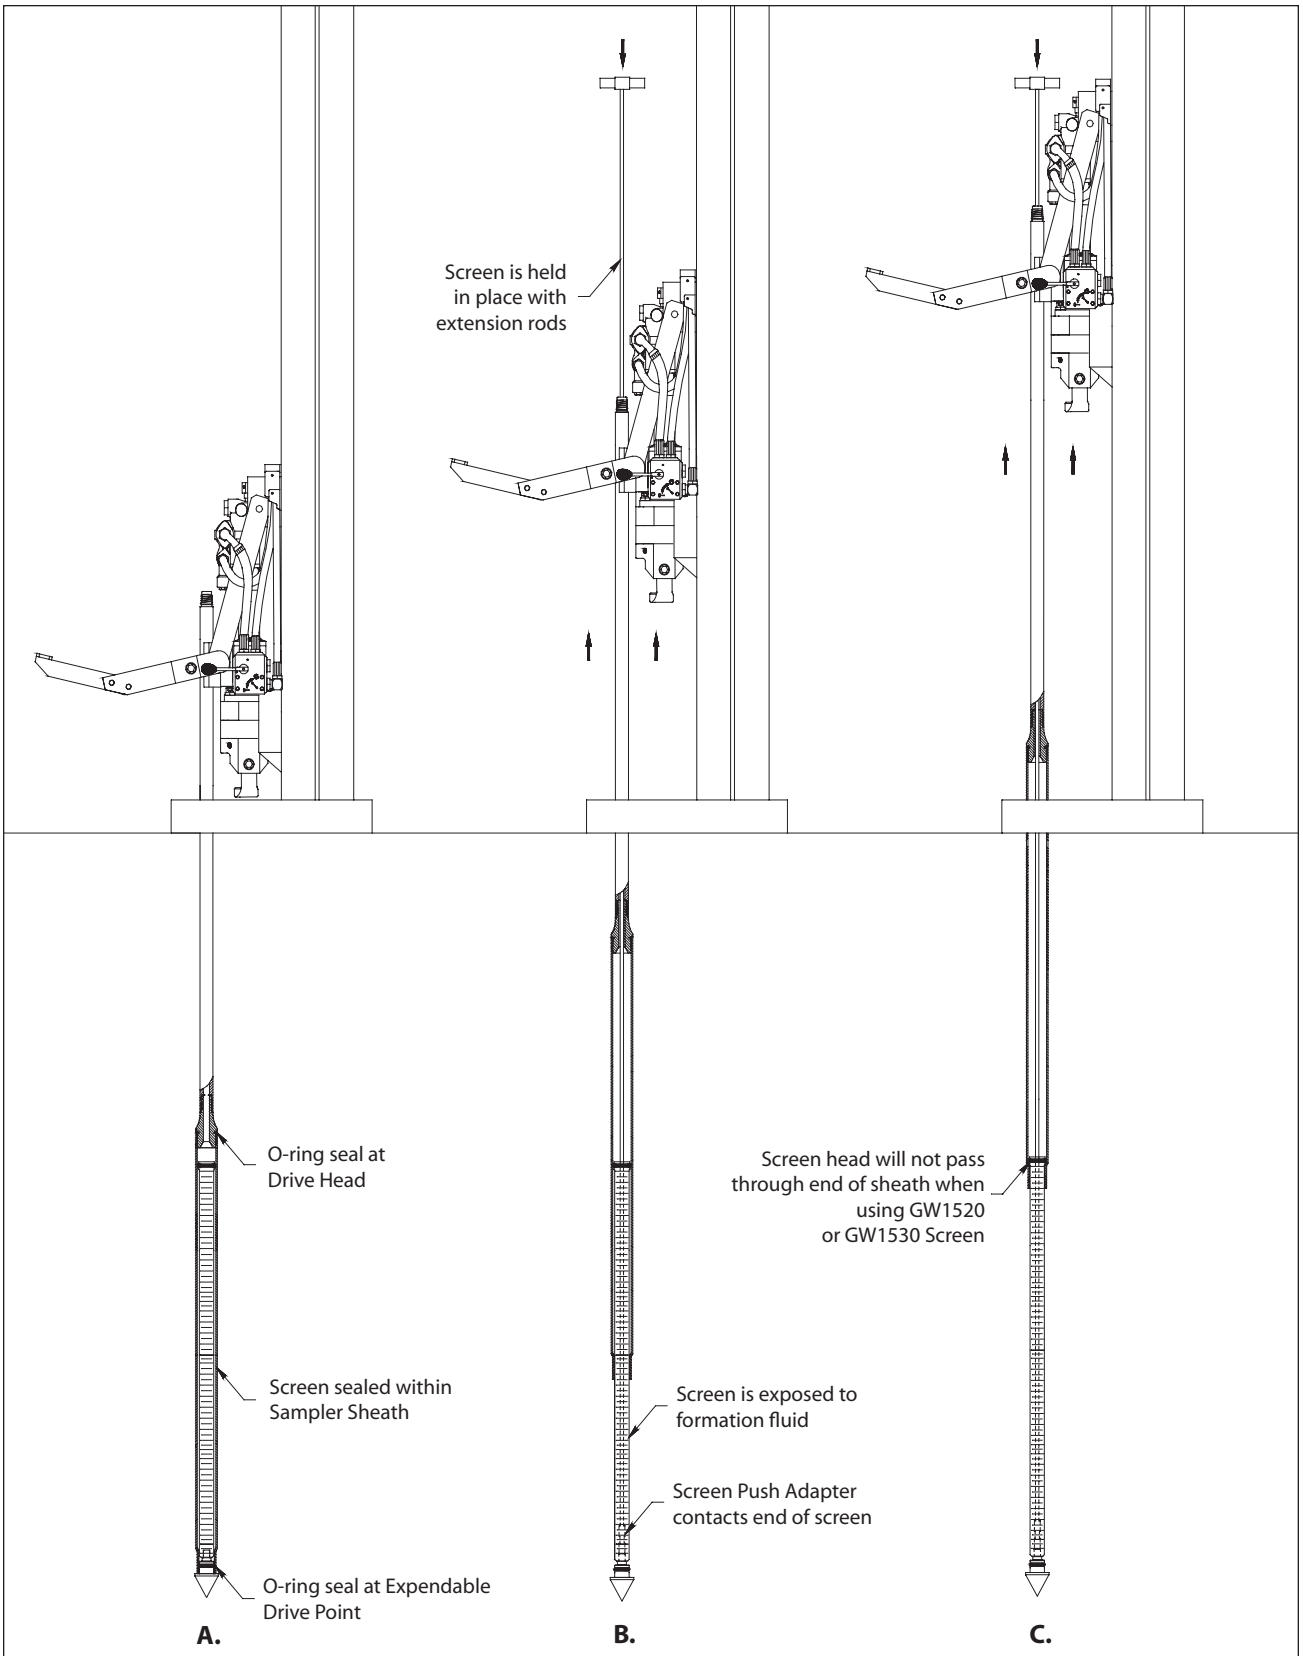

FIGURE 4.3
Screen Deployment for SP16 Sampler

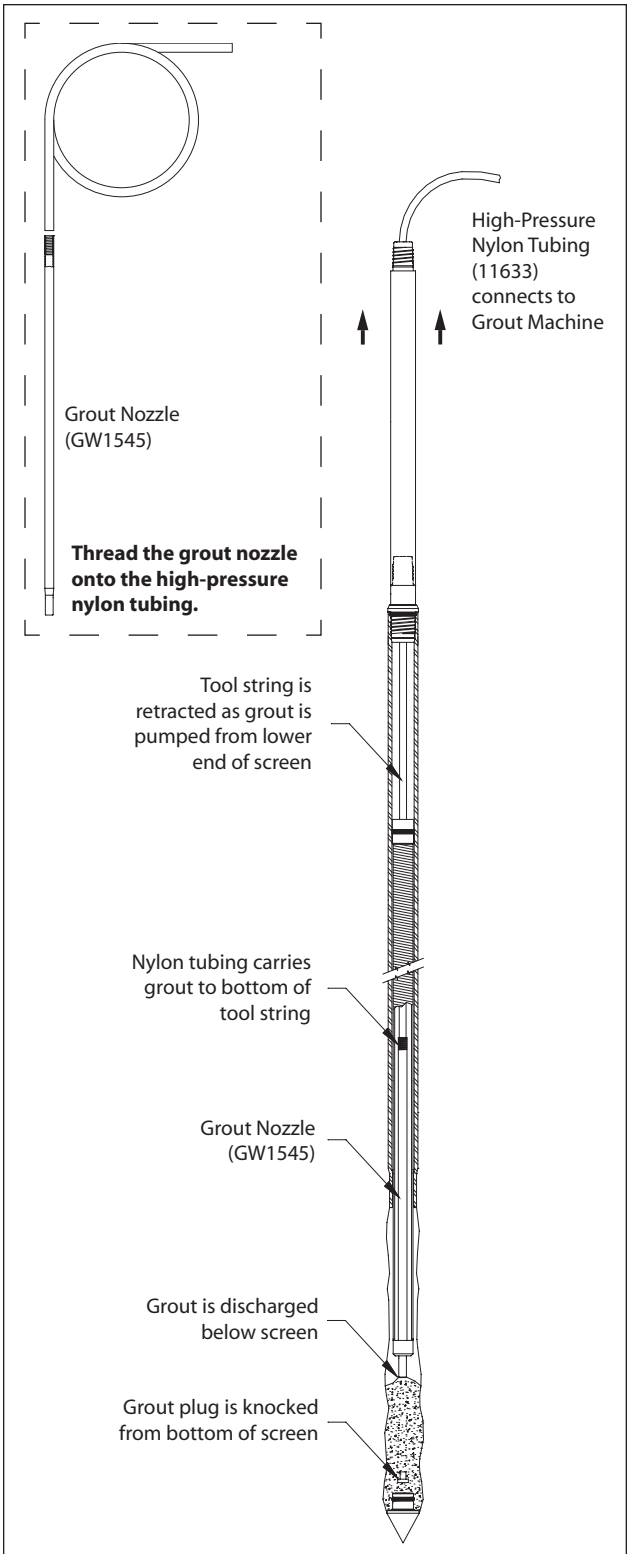

FIGURE 4.4
Grouting the SP16 Sampler With a GW1520 or GW1530 Screen

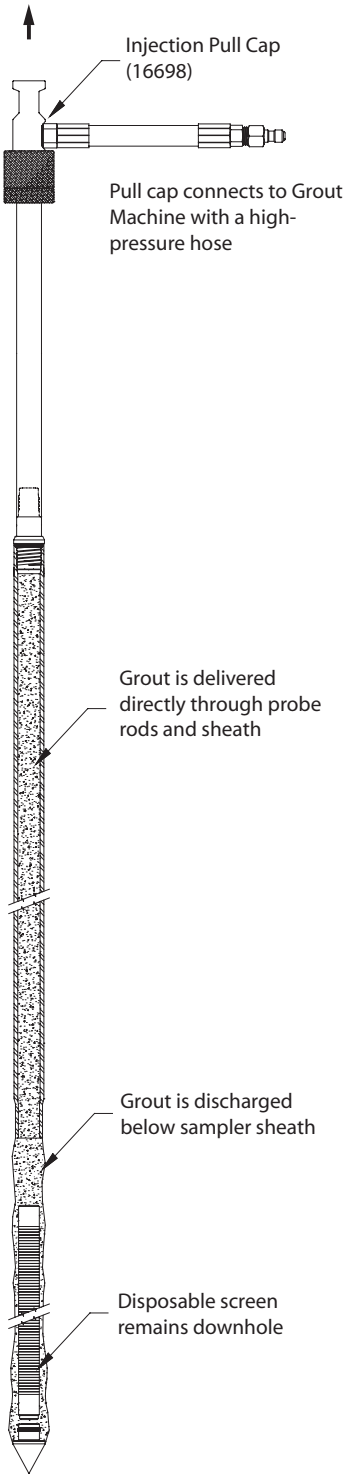

FIGURE 4.5
Grouting the SP16 Sampler With a 16089 Disposable Screen

3. Place a mark on the extension rod even with the top of the probe rod. Apply downward pressure on the extension rods and push the grout plug out of the screen. The mark placed on the extension rod should now be below the top of the probe rod. Remove all extension rods.

   Note: When working with a stainless steel screen, it may be necessary to raise and quickly lower the extension rods to jar the grout plug free. When the plug is successfully removed, a metal-on-metal sensation may be noted as the extension rods are gently "bounced" within the probe rods.

4. A Grout Nozzle (GW1545) is now connected to High-Pressure Nylon Tubing (11633) and inserted down through the probe rods to the bottom of the screen (Fig. 4.4). It may be necessary to pump a small amount of clean water through the tubing during deployment to jet out sediments that settled in the bottom of the screen. Resistance will sometimes be felt as the grout nozzle passes through the drive head. Rotate the tubing while moving it up-and-down to ensure that the nozzle has reached the bottom of the screen and is not hung up on the drive head.

   Note: *All probe rods remain strung on the tubing as the tool string is pulled. Provide extra tubing length to allow sufficient room to lay the rods on the ground as they are removed. An additional 20 feet is generally enough.*

5. Operate the grout pump while pulling the first rod with the rod grip pull system. Coordinate pumping and pulling rates so that grout fills the void left by the sampler. After pulling the first rod, release the rod grip handle, fully lower the hammer, and regrip the tool string. Unthread the top probe and slide it over the tubing placing it on the ground near the end of the tubing.

6. Repeat Step 5 until the sampler is retrieved. Do not bend or kink the tubing when pulling and laying out the probe rods. Sharp bends create weak spots in the tubing which may burst when pumping grout. Remember to operate the grout pump only when pulling the rod string. The probe hole is thus filled with grout from the bottom up as the rods are extracted.

7. Promptly clean all probe rods and sampler parts before the grout sets up and clogs the equipment.

4.8 Abandonment Grouting for the 16089 Disposable Screen

ASTM D 5299 requirements can also be met for the SP16 samplers when using the 16089 disposable screen. Because the screen remains downhole after sampling, the operator may choose either to deliver grout to the bottom of the tool string with nylon tubing or pump grout directly through the probe rods using an Injection Pull Cap (16698). A GS500 or GS1000 Grout Machine is needed to pump grout into the open probe hole as the sampler is withdrawn. The following procedure is presented as an example only and should be modified to satisfy local abandonment grouting regulations.

1. Maneuver the probe assembly into position for pulling with the rod grip puller.

2. Thread the screen push adapter onto an extension rod. Insert the adapter and extension rod inside the probe rod string. Add extension rods until the adapter contacts the bottom of the screen. Attach the handle to the top extension rod.

3. The disposable screen must be extended at least 46 inches (1168 mm) to clear the bottom of the sampler sheath. Considering the length of screen deployed in Section 4.7, determine the remaining distance required to fully extend the screen from the sheath. Mark this distance on the top extension rod.

4. Pull the tool string up to the mark on the top extension rod while holding the disposable screen in place.

   The screen is now fully deployed and the sampler is ready for abandonment grouting. Apply grout to the bottom of the tool string during retrieval using either flexible tubing (as described in Section 4.7) or an injection pull cap (Fig. 4.5). This section continues with a description of grouting with a pull cap.

5. Remove the rod grip handle and maneuver the probe assembly directly over the tool string. Thread an Injection Pull Cap (16698) onto the top probe rod and close the hammer pull latch over the top of the pull cap.

6. Connect the pull cap to a Geoprobe® grout machine using a high-pressure grout hose.

7. Operate the pump to fill the entire tool string with grout. When a sufficient volume has been pumped to fill the tool string, begin pulling the rods and sampler while continuing to operate the grout pump. Considering the known pump volume and sampler cross-section, time tooling withdrawal to slightly "overpump" grout into the subsurface. This will ensure that all voids are filled during sampler retrieval.

   The grouting process can lubricate the probe hole sufficiently to cause the tool string to slide back downhole when disconnected from the pull cap. Prevent this by withdrawing the tool string with the rod grip puller while maintaining a connection to the grout machine with the pull cap.

4.9 Retrieving the Screen Point 16 Sampler

If grouting is not required, the Screen Point 16 Sampler can be retrieved by pulling the probe rods as with most other Geoprobe® applications. The Rod Grip Pull System should be used for this process as it allows the operator to remove rods without completely releasing the tool string. This avoids having the probe rods fall back downhole when released during the pulling procedure. A standard Pull Cap (15164) may still be used if preferred. Refer to the Owner's Manual for your Geoprobe® direct push machine for specific instructions on pulling the tool string.

Appendix A
ALTERNATIVE PARTS

The following parts are available to meet unique soil conditions. See section 3.0 for a complete listing of the common tool configurations for the Geoprobe® Screen Point 16 Groundwater Sampler.

SP16 Sampler Parts and Accessories	**Part Number**
SP16 Drive Head, 0.625-inch bore, 1.5-inch rods	15188
Expendable Drive Points, aluminum, 1.625-inch OD (Pkg. of 25)	GW1555ALK
Expendable Drive Points, steel, 1.75-inch OD (Pkg. of 25)	17066K
Screen, PVC, 10-Slot	GW1530
Screen, Disposable, PVC, 10-Slot	16089

Groundwater Purging and Sampling Accessories	**Part Number**
Polyethylene Tubing, 0.25-inch OD, 500 ft	TB17L
Polyethylene Tubing, 0.5-inch OD, 500 ft	TB37L
Polyethylene Tubing, 0.625-inch OD, 50 ft	TB50L
Check Valve Assembly, 0.25-inch OD Tubing	GW4240
Check Valve Assembly, 0.5-inch OD Tubing	GW4220
Check Valve Assembly, 0.625-inch OD Tubing	GW4230
Water Level Meter, 0.375-inch OD Probe, 100-ft. cable	GW2001
Water Level Meter, 0.438-inch OD Probe, 200-ft. cable	GW2002
Water Level Meter, 0.375-inch OD Probe, 200-ft. cable	GW2003
Water Level Meter, 0.438-inch OD Probe, 30-m cable	GW2005
Water Level Meter, 0.438-inch OD Probe, 60-m cable	GW2007
Water Level Meter, 0.375-inch OD Probe, 60-m cable	GE2008

Grouting Accessories	**Part Number**
Grout Machine, auxiliary-powered	GS500

Probe Rods, Extension Rods, and Accessories	**Part Number**
Probe Rod, 1.5-inch x 1-meter	17899
Probe Rod, 1.5-inch x 48-inch	13359
Drive Cap, 1.5-inch rods (for GH40 Series Hammer)	15590
Rod Grip Pull Handle, 1.5-inch Probe Rods (for GH40 Series Hammer)	GH1555
Extension Rod, 48-inch	AT671
Extension Rod, 1-meter	AT675

Equipment and tool specifications, including weights, dimensions, materials, and operating specifications included in this brochure are subject to change without notice. Where specifications are critical to your application, please consult Geoprobe Systems®.

Appendix B

Laboratory Analyses and Quality Assurance/Quality Control Review

Appendix B

Laboratory Analyses and Quality Assurance/Quality Control Review

A quality assurance and quality control review was conducted to assess the integrity of the field procedures and the validity of the analytical results for the October 2016 to January 2017 sampling period. The analytical data were evaluated according to the procedures outlined in the Barr Standard Operating Procedures (SOPs), which are based in part on guidance from the National Function Guidelines as well as QA/QC protocols from approved analytical methods.

Field Procedures

A review of the analytical results for the blanks associated with field and transport activities (variously named trip, field, equipment and rinsate, depending on function) and field duplicates were conducted to assess the integrity of the sampling procedures and the analytical results. Trip blanks are typically constrained to volatile analyses; however, trip blanks were analyzed separately for PFAS and were treated as traditional trip blanks for the purposes of QC review.

Blanks associated with field and transportation activities were analyzed to determine the extent of potential contamination introduced during sample collection and transport. During most sampling events one or more target analyte was observed in at least one of the various types of blanks. Because nearly every sample delivery group (SDG) was submitted with one or more of the various blanks categories, the results from blank detection were applied to samples submitted only within the concurrent SDG and not to adjacent sampling periods. Where a blank measuring field activities was not collected with a SDG, the resultant data was not evaluated for blank contamination. Where two or more blank types associated with a SDG had detectable concentrations of target parameters, the highest reported concentration was used for the determination of qualification based on potential blank contamination. The field and transportation blank results were not used in several cases where method blanks indicated a potential intra-laboratory blank contamination issue and the collected blanks were less than five times that of the method blank.

Where sample detections of target parameters were less than five times that detected in the field or transportation blanks, the result was qualified as potential blank contamination. No qualifiers were applied to samples results greater than five times that detected in the field or transportation blanks.

Field duplicate samples were collected and analyzed to determine the precision of the analytical data. In general, field duplicate data are considered valid if the relative percent difference (RPD) does not exceed 30 percent for aqueous matrices and 40 percent for solid matrices. The 30/40 percent criteria excludes instances where data are reported less than five times the reporting limit, a level where small absolute concentration differences can result in very high calculated RPDs even though the sampling and analytical reproducibility otherwise meets all project needs.

No qualification was applied when the exceedance was slightly above the target acceptance criteria in accordance with Barr SOPs and the recommendations found in the National Functional Guidelines for data review. All other cases not falling within the above criteria were qualified accordingly as estimated values. All remaining field duplicate samples displayed acceptable RPDs for all target compounds.

Laboratory Procedures

Technical Holding Times

Technical holding times were evaluated for each sample and target parameter based on the EPA recommendations listed in SW 846 "Test Methods for Evaluating Hazardous Waste".

All technical holding times were within recommendations.

Precision and Accuracy Data

The accuracy and precision of the analytical process was reviewed by comparing sample matrix spike (MS) and matrix spike duplicate (MSD), laboratory control sample (LCS) and laboratory control sample duplicate (LCSD) percent recoveries for spiked target compounds. Accuracy was evaluated by comparing the percent recoveries of the target compounds to laboratory acceptance limits. Precision was evaluated using the percent recoveries of the LCS/LCSD and MS/MSD data and calculating the relative percent difference between the two recoveries.

LCS/LCSD recoveries for NEtFOSAA and PFTriA were slightly outside laboratory acceptance criteria in two separate SDGs. Because the deviations were less than 5 percent in either case, no significant impact is expected to have occurred on the associated results and no qualifiers were applied. In a separate SDG, the LCS and LCSD recoveries for acetone were above laboratory acceptance criteria. As none of the associated sample sin the SDG reported detectable concentrations of acetone, no qualification was required. All remaining LCS and LCSD recoveries met laboratory acceptance criteria.

It is noted that MS/MSD sample results reported by the laboratory included project and non-project specific samples. Where MS/MSD recoveries and/or associated RPDs failed acceptance criteria and where the sample was associated with another laboratory client, acceptance of the sample results were based on the acceptable LCS/LCSD data which indicate in-control analytical systems during this project. Results of MS/MSD samples not specific to this project are not discussed herein.

In several cases over the course of the sampling period, MS and/or MSD recoveries were slightly outside laboratory acceptance criteria. In accordance with Barr SOPs for standard-level data review, results were not qualified for cases of minor deviations from laboratory acceptance criteria. MS/MSD recoveries for several analyses of nitrate+nitrite, PFOS, chloride and sulfate were outside laboratory acceptance criteria and the associated source samples were qualified accordingly as estimated values. MS and/or MSD recoveries for 1,2-Dibromo-3-chloropropane, 2-hexanone, NEtFOSAA and NMeFOSAA were above laboratory acceptance criteria for one sample, indicating a potential high bias. Due to the source sample

being non-detect for all of the affected parameters, no qualification was required. All remaining MS/MSD sample results displayed acceptable percent recoveries and RPDs.

Surrogate Standards

Surrogate standard percent recoveries were evaluated for all organic samples. A number of samples displayed multiple surrogate recoveries for PFAS that were outside laboratory acceptance limits. The laboratory includes the following statement with each report:

> *The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.*

As such, some flexibility was allowed in terms of surrogate recoveries based on the trends observed in the surrogate recoveries, which seemed to indicate a broader statistical acceptance criteria would likely be adopted in the future, at least on the lower end of acceptance. As a result, samples with recoveries less than 5 percent outside the stated advisory limits (70-130%) were not qualified. In all other cases where surrogate recoveries were greater than 5 percent outside acceptance criteria, sample results were qualified as estimated values. Qualification was constrained to the target PFAS structurally-associated with the labeled PFAS which failed to meet the transitional surrogate recovery limits. In general, surrogate recoveries for PFAS were below advisory acceptance criteria when outside the transitional limits.

All remaining surrogate recoveries were within laboratory acceptance limits.

Laboratory Method Blank Results

Total alkalinity and calcium occurred a number of times in the method blanks. In general, the sample concentrations were greater than five times that in the method blank and no qualification was required. In a few instances, sample results were below this threshold and were qualified accordingly as potential blank contamination. Method blanks for samples collected in October 2016 occasionally reported trace concentrations of the following PFAS: PFOA, PFBA, PFPeA, and PFHxA. Two method blanks associated with samples submitted in mid-January 2017 additionally had trace detections of magnesium. In all cases, where associated samples reported concentrations less than five times that in the method blank, the affected results were qualified to indicate potential blank contamination. No other method blanks contained detectable concentrations of target compounds.

Conclusion

The quality control review determined all data acceptable as presented in the data tables.

Appendix C

Groundwater Flow Modeling

Appendix C

Groundwater Flow Modeling

1.0 Introduction

A groundwater flow model was developed and used to simulate flow in the saturated groundwater flow system near the Merrimack Village District (MVD) municipal water supply wells #4 and #5 (MVD-4/5) in Merrimack, New Hampshire (Figure 1-1). The groundwater flow model was developed to assess hydraulic capture of wells MVD-4/5 from potential poly-and perfluoroalkyl substances (PFAS) sources by quantifying the water balance of the pumping wells at various historical operational rates. The purpose of the model is to help understand how PFAS compounds may have reached the MVD wells by delineating where the wells draw water from under various pumping conditions. For example, the modeling results indicate that the fraction of water pumped from wells MVD-4/5 ranges for 0 under long-term average pumping conditions to 12 percent under summer pumping conditions under normal recharge rates and river stages. The following sections provide details on the groundwater flow modeling.

The groundwater flow model was developed using the U.S. Geological Survey's MODFLOW-NWT code (Niswonger et al., 2011). The MVD-4/5 Model was calibrated using historical aquifer test data (EGGI, 2003), synoptic water level measurements, and estimated water table elevations from the northern aquifer profiling transect. The sensitivity of the calibrated model to its parameter values was assessed along with the uncertainty of a prediction of the fraction of water withdrawn by wells MVD-4/5 under summer pumping conditions that passes under the Longa Disposal Area (LDA). This prediction ranges from less than 1.6 percent to approximately 15 percent.

A long-term simulation of pumping rate, recharge, and river stage variation was performed. Results from the long-term simulation, using only the calibrated model parameters, indicate that the prediction ranges from 0 to approximately 3 percent through time, depending primarily on the pumping rate of wells MVD-4/5.

This document is an appendix to a report on the MVD-4/5 area investigation (MVD-4/5 Report). An upcoming report will describe conceptual modeling of PFAS fate and transport throughout the Merrimack, New Hampshire region (CSM Report; Barr, 2017). Due to timing considerations, the model described in this appendix was developed prior to completion of the regional-scale model that will be presented in the CSM report.

All groundwater flow models are simplifications of reality and have uncertainty related to their construction, their inputs, and, consequently, their outputs. As noted above, the uncertainty of a specific model prediction was evaluated. The uncertainty in that prediction stems from a combination of the assumptions made in constructing the model and defining the model inputs, the inherent variability of the physical properties represented by the model inputs, the calibration methodology, and the methodology used in evaluating the predictive uncertainty. The model is useful for evaluating groundwater flow to wells MVD-4/5.

2.0 Groundwater Flow Model Development

Sources of data that were used for construction and optimization of the groundwater flow model include the data collected during the current investigation, the report on the geology, hydrogeology, and previous aquifer testing at wells MVD-4/5 (EGGI, 2003); and State of New Hampshire and U.S. Geological Survey (USGS) reports, and data sets regarding the thickness and transmissivity of the unconsolidated aquifer, water table elevation, and stream locations and elevations.

2.1 Miscellaneous Modeling Details

2.1.1 Code Selection

MODFLOW was selected for simulating groundwater flow based on its extensive benchmarking; it is the most widely-used groundwater flow model in the world. The NWT version of the MODFLOW was selected for its capability of simulating units with varying saturated thickness, a critical factor in a recharge-dominated system with an unconfined uppermost aquifer such as the MVD-4/5 well field.

2.1.2 Horizontal Datum and Vertical Datum

The horizontal datum chosen for model development is UTM NAD83 Zone 19N meters. For groundwater flow modeling purposes using MODFLOW, the horizontal and vertical distance units must be the same, therefore meters were used for vertical distances to be consistent with the horizontal datum.

The vertical datum chosen for model development is NGVD 29 meters. EGGI (2003) used NGVD 29 feet in reporting groundwater elevations and river stages. The USGS uses NGVD 29 feet for the Merrimack River gauge at Goffs Falls (USGS, 2016b). CT Male uses NAVD 88 feet in their surveying, groundwater elevation, and river stage recordings.

2.2 Conceptual Hydrogeologic Model

A conceptual hydrogeologic model (CHM) represents "an interpretation or working description of the characteristics and dynamics" of a physical system (ASTM, 2013). The CHM is based on interpretation of available site data and review of work by others in the model domain. The CHM is presented in pictorial representations and represents a simplification of the field problem for purposes of analysis (Anderson and Woessner, 1992). The CHM is a simplification of the real-world groundwater problem that captures the essential features of the real-world problem, and facilitates a mathematical representation of the problem (Haitjema, 1995).

This section presents the CHM for the MVD well field. Figure 2-1 illustrates the CHM and is discussed in more detail below. The overall hydrogeologic setting is summarized and site specific information about groundwater-surface water interactions is presented along with a discussion of interaction with the bedrock aquifer system.

2.2.1 Hydrogeologic Setting

A detailed description of the hydrogeologic setting of the MVD-4/5 well field will be presented in the CSM Report; a summary is presented here.

Merrimack is located in the Northeastern Appalachians groundwater region (Randall et al., 1988), and the following summary is condensed from that resource unless otherwise indicated. This region is characterized by rolling topography that primarily reflects the weathered bedrock surface with glacial and fluvial landforms mantling the bedrock. The bedrock consists of folded and faulted metamorphosed sedimentary rocks with low primary porosity. Water is conducted in the bedrock through secondary porosity (see note E, Figure 2-1). Recharge from infiltrating precipitation is generally the most important source of groundwater and discharge to rivers is the most important groundwater sink. Characterizing recharge and discharge is the key to understanding groundwater flow directions.

Glacial erosion and deposition produced changes in drainage and topography and deposited a nearly continuous layer of unconsolidated till over the bedrock. Stratified drift units, chiefly sand and gravel, follow the larger valleys such as those of the Merrimack River. These stratified drift units are referred to as valley-fill aquifers (Kontis, et al, 2004).

Recharge to the bedrock is controlled by the permeability and thickness of the overlying glacial deposits and overburden. Runoff in upland areas is focused to seasonal streams that typically lose discharge in areas in which they flow over stratified drift at the margins of the larger valleys (note D, Figure 2-1). Recharge to bedrock wells that are pumped continuously may occur from adjacent stratified drift aquifers (notes A and 5, Figure 2-1). Discharge is primarily from the bedrock to wells and to the stratified drift in the large valleys. Inter-basin flow systems with significant discharge have not been discovered in the bedrock.

In addition to discharge to the stratified drift filling the larger valleys from minor upland streams, recharge to these units is from direct infiltration of precipitation, and discharge from bedrock (notes B and E, Figure 2-1). Recharge from the larger rivers may take place in the vicinity of localized pumping from the stratified drift (note F, Figure 2-1). Under normal conditions, the main stream in the major valleys consistently gains water from stratified drift aquifers (Kontis, et al, 2004). The Merrimack River acts as a source of groundwater in the aquifer adjacent to the river during periods of rising river stage (a process known as bank storage; Kontis, et al, 2004) and a sink for groundwater during periods of falling and sustained low river stage. Discharge from the stratified drift is via pumping wells, evapotranspiration, and to the larger rivers when their stage is at or below typical levels.

2.2.2 Groundwater-Surface Water Interactions

Aquifer testing performed in 2003 using (EGGI, 2003) using wells MVD-4/5 indicated the alluvial materials along the Merrimack River have a strong hydraulic connection with the river. Two temporary piezometers and a river stage monitoring gauge were installed for the 2003 testing. Hydrographs from both of the piezometers and the river showed quite similar elevations and similar variations in elevation during the testing period. The river hydrograph and one of the piezometer hydrographs are presented in Figure 2-2.

No measureable drawdown occurred in the temporary piezometers. The hydrograph from the permanent well 45-5A showed an apparent influence from the river stage variations (Figure 2-2). Well 45-5A was the closest permanent well to the river at that time and the only permanent well in which influence from the river was noted. The hydrograph from well 45-4A, unaffected by river stage variations, is included on Figure 2-2 to illustrate a typical response to the aquifer testing.

The relatively high contribution of groundwater to the flow in rivers and streams in the investigation area is supported by an assessment of baseflow. Baseflow is the component of streamflow that is sustained by groundwater discharge to the stream, and the baseflow index (BFI) for a streamflow measurement location is the proportion of total streamflow that is baseflow. A BFI of approximately 0.69 was estimated for the Merrimack River in Lowell, MA (USGS Gage 01100000) (CDM, 2004). This value indicates that approximately 70 percent of the total streamflow measured at the gaging station originates as baseflow.

Some component of downvalley groundwater flow likely occurs in the stratified drift beneath the Merrimack River and in places where a floodplain has developed adjacent to the river. Downvalley groundwater flow occurs in areas where the hydraulic gradient parallels and roughly equals the downvalley slope of the floodplain and is referred to as underflow (Kontis, et al, 2004). The Merrimack River is incised through terrace deposits and has very narrow alluvial deposits on the west (right) bank through much of the reach between the St. Gobain Facility and the MVD well field (Figure 2-3). The alluvial deposits on the right bank widen in the vicinity of the MVD well field.

The USGS water table map of the area (Toppin, 1987), indicates no significant zone of downvalley groundwater flow at any appreciable distance from the Merrimack River; groundwater flows directly toward the Merrimack River (Figure 2-4A). Groundwater elevation contours for a site investigation within the model domain also indicate underflow is not occurring at a large scale between the SGPP facility and the MVD wells (Aries Engineering, Inc., 1990). The location of this site, known as the Yield House Site, is shown on Figure 2-4A. The groundwater elevation contour map for the site is shown on Figure 2-4B.

Pumping of wells MVD-4/5 created a cone of depression that extended to the river and created roughly radial flow toward the wells and induced some amount of recharge from the river to the valley-fill aquifer near the well field (EGGI, 2003). Medalie and Moore (1995) refer to this process as induced infiltration. Overall, underflow is not believed to be a significant factor in the model domain, particularly in the reach between the St. Gobain Facility and the MVD well field due primarily to the limited extent of alluvial deposits in that reach. In other words, groundwater discharging to the alluvial deposits may move some distance downstream prior to discharging to the Merrimack River, but that downstream distance is limited due to the narrow width of the alluvial deposits.

2.2.3 Interaction with bedrock

EGGI (2003) considered contributions from the underlying bedrock aquifer to be negligible, however, the report states that they did not evaluate those contributions in their investigation. Flow of groundwater from the bedrock, through the unconsolidated materials, and discharging to the regional discharge zone (the Merrimack River in this case) is an integral part of the regional CHM (e.g., Randall, et al, 1988; Kontis,

et al, 2004), therefore a mechanism was included in the MVD-4/5 Model to simulate such discharge as described below.

2.3 Model Domain

The model encompasses the unconsolidated aquifer from which the MVD wells withdraw water from the well field to major hydrologic features (Baboosic Brook, the Souhegan River, and the Merrimack River), and extends to areas where the unconsolidated aquifer pinches out.

The extent of the model domain in MVD-4/5 Model layer 1 is shown on Figure 1-1. The model domain in layer 1 extends beyond Baboosic Brook and the reach of the Souhegan River downstream of the confluence with Baboosic Brook (to the south and west) and to the midpoint of the Merrimack River (to the east). The northern extent of the model follows areas of thin or absent unconsolidated aquifer, as defined by the USGS (Toppin, 1987; Koteff and Stone, 2000) and shown on Figures 2-3 and 2-4. With one minor exception, all of the lateral model boundaries are physical boundaries as defined by Anderson, Woessner, and Hunt, (2015). See Section 2.5 for details on the model boundary conditions.

If the model included one or more layers to explicitly simulate the bedrock, extension of the model domain to physical boundaries with respect to the bedrock aquifer would likely have resulted in a model that was too large to accomplish the stated objectives and intended uses for the MVD-4/5 Model. As noted above, a regional groundwater flow model was not available for establishing hydraulic boundaries (Anderson, Woessner, and Hunt, 2015), such as head-dependent flux boundaries, to represent the bedrock aquifer beyond the limits of a model domain including a bedrock layer or layers. The decision was therefore made to simulate inflow from the bedrock using the boundary conditions described below.

2.4 Model Discretization

As related to MODFLOW models, the term "discretization" refers to division of a model domain into cells in plan view and into layers vertically and division of a time-varying simulation into segments of time referred to as stress periods. Stress periods may be further subdivided into multiple time steps.

2.4.1 Spatial Discretization

The model domain was discretized in plan view with an irregular grid with cell sizes ranging from 3 to 30 meters. The finest grid spacing is around wells MVD 4 and 5. The grid is not rotated; rows are oriented east-west and columns are oriented north-south.

Based on the various screen elevations of MVD observation wells and the overall thickness of the unconsolidated aquifer, three vertical layers were used. Three layers were sufficient to capture the geometry of the unconsolidated aquifer, the aquifer's "pinching out" to the west from the Merrimack River valley, and the effects of partial penetration of the water supply and monitoring wells.

A regional water table map was used to define the top of the MVD-4/5 Model (Toppin, 1987, Plate 3). Saturated thickness values derived from a regional map (Toppin, 1987, Plate 4), augmented with available

data from the EGGI study (2003) and the current investigation, were subtracted from the water table surface to define the base of the MVD-4/5 Model. This surface was used for the base of layer 1 beyond the active limits of layers 2 and 3 and for the base of layer 2 beyond the active limits of layer 3, and for the base of layer 3 throughout the active limits of this layer.

2.4.2 Temporal Discretization

MODFLOW model inputs were developed to simulate the EGGI (2003) aquifer testing and conditions in November 2016 when synoptic groundwater elevation measurements and other estimates were made as part of current investigation. Table 1 summarizes the transient stress period definitions for simulating the 2003 aquifer testing.

Table 1 MODFLOW Stress Period Definitions for Simulating the EGGI (2003) Aquifer Testing

Begin SP[1]	End SP	Date/time	SP length (days)	Time steps	Comment/event
1	NA	04/28/2003 21:25:26	7.524	20	Last cycling of pump in MVD5; MVD4 not logged at this time - likely also cycled. Start of shutdown period.
2	1	05/06/2003 10:00:00	1.0	10	MVD5 pumping alone
3	2	05/07/2003 10:00:00	5.0	15	MVD4 pumping starts
4	3	05/12/2003 10:00:00	7.0	20	Both pumps shut off
NA	4	05/19/2003 10:00:00			End of recovery monitoring

[1]SP – MODFLOW stress period

2.5 Boundary Conditions

Boundary conditions in MODFLOW allow for simulation of the influence of hydrologic features such as surface water bodies, portions of the aquifer system beyond the domain of the current model, or wells on the simulated groundwater flow system. As noted in Section 2.3, the model domain is defined with physical boundaries which are the most robust and defensible type of boundary condition to use; physical boundaries include contacts with units of low hydraulic conductivity and surface water features (Anderson, Woessner, and Hunt, 2015). Use of physical boundaries does not preclude the flow of water from beyond those boundaries into the model domain. The boundary conditions defined for the MVD-4/5 Model are described below.

2.5.1 Recharge

The amount of direct precipitation that infiltrates the land surface and moves below the root zone is the maximum amount of water available to recharge the groundwater system. This amount is dependent upon the rate and duration of precipitation, the soil type, land cover, land use, evapotranspiration, and topography.

Recharge to the aquifer from infiltrating precipitation was estimated using the Soil Water Balance (SWB) model, developed by (Westenbroek et. al., 2010). SWB was used to calculate spatial and temporal variations of infiltration rates across the study area.

The SWB model calculates components of the soil water balance on a daily basis. Inputs to the SWB model include the following:

- Daily precipitation and daily minimum and maximum temperatures: These data were obtained for a single location representing the Merrimack area for the period 1989 to 2016.
- Land cover classifications: These data were obtained the National Land Cover Database.
- Hydrologic soil group and soil water capacity: These data were obtained from the Natural Resources Conservation Service soil survey geographic database.
- Surface flow direction as inferred from topography: Topography data were obtained from the U.S. Geological Survey seamless elevation dataset.
- Monthly infiltration grids, as output from the SWB model, were used to define the recharge boundary in the groundwater flow model.

Strictly speaking, infiltration is similar to but differs from groundwater recharge. The most important distinction between infiltration and recharge is the time lag between infiltration of water past the root zone and recharge at the water table. In addition, small-scale processes such as local flow systems and rejection of infiltration due to saturated soils at the ground surface often result in differences between recharge and infiltration. Despite these differences, calculated infiltration rates and groundwater recharge are considered to be approximately equal and are treated as such in this evaluation.

The calibrated MVD-4/5 Model uses the average 2003 infiltration rate on a cell-by-cell basis for input to the recharge package (Figure 2-5). The simulated recharge rate over the model domain averages 21.1 inches per year. Recharge rates for a stratified drift aquifer in the same county were estimated at 19.8 inches per year (Ayotte and Toppin, 1992). Average annual recharge of 21 inches per year was inferred from streamflow records in basins throughout Vermont and New Hampshire for the period of record from 1961 to 1990 (Flynn and Tasker, 2004). A reasonable rate of recharge through sandy soils in New Hampshire is considered to be 18 to 21 inches per year (Emery & Garrett Groundwater, Inc., 2003, p. 13). Baseflow indices for the Merrimack River at Lowell, MA expressed as an effective recharge rate range from 11.55 inches per year for drought periods, to 19.22 inches per year for periods with normal precipitation, to 22.72 inches per year for wet periods (CDM, 2004).

2.5.2 Area Rivers and Brooks

The Merrimack River, Baboosic Brook, and the Souhegan River are represented using the river package (Figure 2-6). The distribution of these boundary cells in the model was set by intersecting hydrography coverages (USGS, 2016a) with the MVD-4/5 Model grid.

As discussed in Section 3.1.5 of the Investigation Report, the slope on the Merrimack River near MVD-4/5 calculated for 11/7 and 11/23/2016 was very low. These are the only available, site-specific estimates of river slope. They are considered representative of long-term conditions based on consistency with field

observations, aerial photo review which show no signs of rapids in the reach adjacent to the MVD-4/5 well field, topographic map review, DEM information (FEMA, 2012), and hydrography coverages (USGS, 2016a).

Baboosic Brook stages and stages assigned to other, unnamed drainages in the model domain were assigned based on interpolating elevations from a LiDAR-based digital elevation model (FEMA, 2012) to the locations of MVD-4/5 Model cells representing these drainages.

Merrimack River stages were assigned based on data collected by EGGI (2003) and data collected during the current investigation. Data gathered during the 2003 aquifer testing (EGGI, 2003) were used to extrapolate river stages near MVD-4/5 based on data available online for the USGS gauging station at Goffs Falls (USGS, 2016b). Historical discharge data and periodic stage measurements were available for the Goffs Falls station. Figure 2-7 shows a rating curve developed for that location. The average daily Merrimack River stages recorded during the 2003 aquifer testing period are plotted against Merrimack River stage at Goffs Falls estimated using the rating curve with daily average discharge during the 2003 aquifer testing period in Figure 2-8. The linear fit to this scatter plot illustrated in Figure 2-8 was used to estimate the river stage near MVD-4/5 and compared with the river stage as recorded at the upstream gauge installed during the current investigation (Figure 2-9).

The river stage comparison shown in Figure 2-9 indicates that the extrapolation method is not as accurate at times when the river stage is changing rapidly. Therefore, the extrapolation is considered applicable to time periods of months, not days or shorter periods (see Section 4.2).

2.5.3 Lateral Boundaries on the Western Margin of Layer 1

The MODFLOW Well Package was used to simulate groundwater flow into the model domain from beyond the physical boundaries selected as the limits of the domain, an approach that is referred to as specified flow boundaries (Anderson, Woessner, and Hunt, 2015). Head-dependent flow boundaries, such as those simulated using the MODFLOW General Head Boundary Package (GHB), were not selected in this case for the following reasons:

- Flow is expected to be unidirectional in all scenarios; in other words, groundwater flow from the opposite side of Baboosic Brook and the Souhegan River is expected to be toward those surface water bodies, not away from them. As noted in Section 4.1, some underflow beneath Baboosic Brook is indicated by the model.
- Use of the GHB Package would have required applying hydraulic heads derived from some independent source and calibrating a conductance term. The net result would have been simulation of groundwater flow into the model domain – the same result produced by using the Well Package.

Well cell zones 1 to 3 represent flux into the model domain from unconsolidated materials beyond the active extent of the model (Figure 2-6).

2.5.4 Lateral Boundaries representing bedrock interactions

As noted above, the northern extent of the model follows areas of thin or absent unconsolidated aquifer. Based on the material types (bedrock and or till), the hydraulic conductivity in this area beyond the model domain is expected to be much lower but not zero, therefore, flow into the model domain in this area is allowed. This boundary is represented as a specified flow boundary in layer 1 to simulate the far-field effects of seepage from the bedrock aquifer and/or till into the unconsolidated aquifer (well cell zone 4, Figure 2-6). The more permeable stream terrace and deltaic deposits pinch out in this area (Figure 2-3), therefore, this flux was expected to be small compared to other water sources to the unconsolidated aquifer. The calibration results are consistent with this expectation.

Specified flow boundaries were also included on the western edges of the active extents of layers 2 and 3 to simulate flow from the bedrock toward the discharge zone (well cell zones 5-7 and 9-11, Figure 2-6). These flows are simulated where the layers pinch out against bedrock rather than across the bottom faces of the active cells in each layer based on the concept that horizontal hydraulic conductivity within the valley-fill aquifer is higher (in many cases much higher) than the vertical hydraulic conductivity.

Figure 2-6 illustrates that physical boundaries representing the interface between the valley-fill aquifer and bedrock in layer 2 are located near the footprint of the LDA and in layer 3 pass beneath the footprint of the LDA. This is not as great a limitation as it may appear. If the bedrock were explicitly modeled with an additional model layer, groundwater flow from the layer representing the bedrock to the layer representing the overlying valley-fill aquifer would be simulated in every cell located in the footprint of the LDA.

2.5.5 Lateral Boundaries representing underflow

The boundary along the northern model extent near the Merrimack River in layers 2 to 3 (well cell zones 8 and 12, Figure 2-6), is represented by a specified flow boundary that is conceptualized as simulating flow from the bedrock to the unconsolidated deposits in areas outside the Merrimack Valley and underflow in the alluvial deposits adjacent to the river. In other words, these boundary cells simulate the potential for a component of flow down the valley in valley-fill aquifer. The available data do not allow differentiation of flow from bedrock from underflow in this part of the model domain.

The boundary along the southern model extent near the Merrimack River in layers 1 to 3 is represented by MODFLOW General Head Boundary Package cells with heads set 0.01 meter lower than the estimated stage of the Merrimack River at the downstream limit of the model domain (Figure 2-6). This modeling approach allows for simulation of induced flow toward the MVD wells when the wells are pumping and down-valley flow out of the model domain when the MVD wells are not pumping (see Section 4.1). This is the one exception to the statement in Section 2.3 that all of the lateral model boundaries are physical boundaries

2.5.6 Outer Model Boundary under the Merrimack River

No additional boundary conditions were applied to the model cells beneath the Merrimack River, therefore the outer edge of the model in this area is a no-flow boundary. This is consistent with the observation that pumping of wells MVD-4/5 did not cause measureable drawdown near the river (EGGI, 2003). The induced infiltration from the river was apparently sufficient to offset the effects of pumping.

2.5.7 Wells

Information on area wells was obtained from the NHDES Water Well Inventory (NHDES, 2016b). Figure 2-10 shows the pumping rates of wells MVD-4/5 in the period of record of these data. Wells MVD-4/5 are the wells in the well inventory located in the model domain. These wells were simulated using the MODFLOW Well Package.

The pumping rates reported by EGGI (2003) were explicitly simulated. Wells MVD-4/5 were not being pumped during the current investigation. See Section 3 for details on simulated pumping rates. Table 2 summarizes pumping rates associated with wells MVD-4/5 in gallons per minute (gpm).

Table 2 Summary of Pumping Rates of Wells MVD-4/5

Scenario Description	Rates (gpm)		
	MVD-4	MVD-5	Total
Long-term average pumping rates	105.8	303.1	408.9
Rates used for period prior to shutdown on 4/28/2003	106.5	309.9	416.3
Rates used to simulate summer pumping conditions	157.5	467.5	625.0
During single-well phase of 2003 aquifer testing	0	660	660
Maximum combined monthly average pumping rate	219.6	556.5	776.1
Maximum monthly average rate per well (values not from same month)	219.6	572.6	792.2
During two-well phase of 2003 aquifer testing	216	660	876

2.6 Hydraulic Conductivity Field

Hydraulic conductivity zonation in the MVD-4/5 Model was derived through consideration of information from the following sources:

- Stratified drift aquifer mapping, which provided an overall extent of drift aquifer, saturated thickness, and transmissivity (Toppin, 1987, Plate 4)
- Stream terrace and alluvium mapping from surficial geology maps for the Merrimack South and Nashua North quadrangles (Koteff, 1976; Koteff and Stone, 2000), shown on Figure 2-3.
- A report on characterization and aquifer testing in the MVD well field (EGGI, 2003)
- Data collected during the current investigation.

The transmissivity zonation near the confluence of the Merrimack and Souhegan rivers as mapped by Toppin (1987) presented difficulties in preliminary model calibration, leading to extreme variations in heads in that area. These zonations were not used in the final model calibration.

Soil type data from the EGGI (2003) well logs and data collected during the current investigation were assembled in a solids model for interpolation throughout the MVD-4/5 Model grid. The Burmister soil classification method was used based on a request from the State of New Hampshire. The dominant soil type for each MVD-4/5 Model cell was determined with indicator kriging using the EVS software package (CTech, 2016). Soil types (lithologies) used in the EVS model and the MVD-4/5 Model are listed in Table 3.

Contiguous groups of MODFLOW cells with the same material type were assigned to zones with uniform material properties. If a given material property was present in multiple groups of cells in a layer, the zones were differentiated in order to allow the parameter values to vary if warranted by the calibration information (Section 3). Likewise, if a given material property was present in the active areas of multiple layers, the zones were differentiated. Zone numbers in the model are listed by layer in Table 3 and shown in plan view on Figure 2-11 and in cross section on Figure 2-12.

Figure 2-12 also shows the model layering, extent of active and inactive cells, and boundary conditions as described in Section 2.5. This cross section is along the row in the model containing well MVD-5.

Table 3 Material Property Zonation in the MVD-4/5 Model

Lithology	Associated Material Property Zone Numbers		
	Layer 1	Layer 2	Layer 3
CLAY	NA[1]	1	Inactive[2]
SILT	2	15	Inactive
FINE SAND	3,16	17,18	19,20
FINE SAND WITH TRACE FINES	4,21,22	4,21,23	Inactive
FINE SAND WITH LITTLE FINES	5,24,25	NA	NA
FINE SAND WITH SOME FINES	6	26	27
COARSE SAND	7	28	29
COARSE SAND WITH TRACE FINES	NA	8	30
COARSE SAND WITH LITTLE FINES	9	NA	NA
COARSE SAND WITH GRAVEL	NA	10	31
FINE SAND TO GRAVEL	11	32	33
FINE SAND TO GRAVEL WITH TRACE FINES	12,34	35	Inactive
FINE SAND TO GRAVEL WITH LITTLE FINES	NA	NA	NA
GRAVEL	14	NA	NA

[1]NA – material type is not present in the indicated MVD-4/5 Model layer

[2]Inactive – material type occurs only in inactive cells in the indicated model layer

3.0 Flow Model Calibration

3.1 Parameters

Model parameters were represented as zones of uniform property values within the model domain, based on the distribution of material types from the EVS model as described in Section 2.7 and inputs related to groups of boundary cells. Parameters used in the model calibration include the following:

- horizontal hydraulic conductivity (Kx) for the zones shown in Figure 2-11,
- vertical anisotropy (defined in MODFLOW as horizontal hydraulic conductivity divided by vertical hydraulic conductivity) - using the same zonation as for Kx,
- specific yield - using the same zonation as for Kx,
- specific storage - using the same zonation as for Kx,
- multipliers on flux rates from bedrock to the unconsolidated deposits and underflow into the model domain for the groups of cells shown in Figure 2-6,
- river-bed vertical hydraulic conductivity for the three groups of cells shown in layer 1 on Figure 2-6, and
- general head boundary conductance representing underflow out of the model domain (see Figure 2-6).

The model calibration included 116 adjustable parameters. Parameter names indicate the type of parameter (such as kx) and the zone number that it is applied to in updating MODFLOW input files during the calibration. Model inputs that were not be adjusted during the calibration include recharge rates, conductance of drain cells representing intermittent streams in the far field, and MVD well pumping rates.

3.2 Observations

The MVD-4/5 Model was calibrated to history-match responses to pumping of wells MVD-4/5 reported by EGGI (2003) and hydrologic data collected as part of the current site investigation. Calibration included transient simulations in order to capture the water-level responses in observation wells during the 2003 testing during the pre-test recovery phase, pumping phases, and post-test recovery phase (see Table 1).

Note that measurements were not made in the LDA monitoring wells and steady-state conditions were not reached at any time during the 2003 testing. In other words, drawdown, which is typically used in model calibration involving aquifer tests, could not be calculated. Wells MVD-4/5 cycled on an off on a daily basis prior to the shutdown period. Despite the shutdown period lasing lasting more than seven days, water levels were still rising when the constant-rate testing began (Figure 2-2). Pre-test conditions were simulated using the average pumping rate for Wells MVD-4/5 prior to the shutdown in a steady-state simulation. These average rates were estimated by adjusting the reported average rates for April 2003 (NHDES, 2016b) to account for the length of time the wells were idle prior to the start of the controlled testing. Following the steady-state stress period, four transient stress periods were used to simulate the shutdown period, pumping of pumping of well MVD 5 alone, pumping of wells MVD 4 and 5 together, and the recovery period (see Table 1).

The model was also calibrated to non-pumping conditions, as represented by measurements conducted as part of the current investigation, including measurements of water levels in the LDA monitoring wells. Groundwater elevation estimates derived from published USGS water table maps were used as calibration targets in the far field (far removed from the MVD wells). These far field observations were added to ensure that hydraulic gradients and flow directions between the far field and near field reasonably matched conditions documented in regional studies, and were created by interpolating the water table mapped by Toppin (1987, Plate 3) to a series of points distributed throughout the far field of the model.

Approximately 694 transient calibration targets from 15 wells were used along with 16 steady-state calibration targets. In addition, head changes in individual wells over short periods of time during the 2003 aquifer test were included as targets in order to better capture the transient responses of water levels in the wells to changes in pumping.

3.3 Calibration Methods

The calibration process was performed by using automated inverse optimization procedures available through PEST (Watermark Numerical Computing, 2016) and PEST_HP (Watermark Numerical Computing, 2017). PEST minimizes the calibration residuals in a least-squares manner (termed the "objective function") using a gradient-based numerical approach. Model parameter values are adjusted within ranges that are specified by the user to be representative of the materials that a given parameter represents. For example, zones representing fine sand in the Burmister system were allowed to vary in hydraulic conductivity from 1 to 30 m/day.

Regularization information is a constraint imposed on an inverse model without being based on measurements located where the constraint is applied, such as specifying that two horizontal hydraulic conductivity parameters be equal regardless of their current values. Parameter bounds were the only form of regularization information used in the model calibration for reasons discussed in the next paragraph.

The Burmister system classification system has limited applicability for estimating hydraulic conductivity; many of the soil types have such large fractions of fines (silt and clay) that the finer materials in the mixture will dictate the hydraulic conductivity regardless of the sizes of the coarser sands and gravel clasts in the mixture. For example, even a sample with trace fines may contain up to 10 percent fines and would have a relatively low hydraulic conductivity due to the resistance of flow caused by the high surface area of the fines (Barr, 2001). Another sample with trace fines may contain as little as 1 percent fines and, therefore, have a significantly higher hydraulic conductivity than the sample with 10 percent fines. Given the potential variability between samples with the same classification, regularization information indicating an expectation of equality of hydraulic conductivity between zones with same classification was not included in the calibration. Similar logic was applied to the other material property parameters.

3.4 Calibration Results

3.4.1 Comparisons of Measured and Modeled Values

Model calibration results are presented in time-series plot and map form, showing the comparison between measured (observed) and modeled (simulated) values for each calibration target. Figures 3-1 through 3-15 show hydraulic head time-series plots from the 2003 aquifer testing and equivalent simulated head values. Notes on the figures indicates cases in which the measured data were not used as calibration targets – such data from wells MVD-4/5 at time when a given well was being pumped, data from the temporary piezometers, in which no drawdown was detected (EGGI, 2003), and data from well 45-5A, which was influenced by river stage variations as well as pumping of wells MVD-4/5. The responses to the pumping test are matched very well by the model.

Figure 3-16 shows scatter plots of modeled versus measured hydraulic head values (blue symbols) and modeled versus measured head changes in individual wells over short periods of time during the 2003 aquifer test (orange symbols). Data falling on the line in this plot labeled "line of zero residuals" represent an exact fit of the modeled and observed values. The plots show no apparent bias and a tight clustering of values around the line of zero residuals.

Figure 3-17 shows contours of the simulated water table elevation with differences between measured and modeled hydraulic head values (residuals) posted by wells from which the measurements were taken. Negative residuals are produced in cases where the modeled heads were higher than the measured heads. The synoptic water level data are the most accurate of the data shown in Figure 3-17, therefore were given the highest weight. The aquifer profiling data and far field heads are less accurate estimates of the water table elevation, therefore larger residuals are acceptable for these observations. The use of a single vertical hydraulic conductivity parameter for the entire Merrimack River bed may have contributed to the modeled heads being lower than the estimated heads at AP08, AP08, and AP10. The observations of no drawdown in the piezometers by the river in the 2003 testing carried much more weight than the aquifer profiling head data. River stages measured on this date are also posted on Figure 3-17. These stages were used as model input, therefore they have no related residual value.

Fits to the synoptic water level data and aquifer profiling data used in the calibration are also summarized on Table 4 in the original measurement units. Fits to all of the observations used in the model calibration are presented in Attachment 1 using the modeling units of meters and days and the modeling datum of meters NVGD 29.

Figure 3-18 shows simulated groundwater elevations in layer 1 for the long-term average pumping scenario and the summer pumping condition scenario. The estimated capture zone for wells MVD-4/5 within the domain of the MVD-4/5 Model is shown for both scenarios. Note that the capture zones would extend west of Baboosic Brook; the model domain is truncated in that area. As noted above, the bedrock is not explicitly simulated in the MVD-4/5 Model, therefore flow paths of water in the bedrock that is captured by wells MVD-4/5 cannot be simulated.

Table 4 Summary of the Synoptic Water Level Data and Aquifer Profiling Data from the Model Calibration

Well/Soil boring	Measured head (ft NAVD 88)	Modeled head (ft NAVD 88)	Residual (ft)
LNG-MW-1	93.45	93.57	-0.12
LNG-MW-2	94.78	96.71	-1.93
LNG-MW-3	94.74	95.16	-0.42
LNG-MW-4*	93.19	93.57	-0.38
45-10	97.86	97.59	0.27
45-11	96.08	96.46	-0.38
45-1MW	99.05	99.96	-0.91
45-2A	98.74	98.62	0.12
45-4A	96.57	96.86	-0.29
45-6	98.51	98.26	0.25
45-7	98.95	98.96	-0.01
45-8	98.58	98.36	0.22
45-9	101.85	101.97	-0.12
AP-07	138.60	143.74	-5.14
AP-08	130.20	128.46	1.74
AP-09	127.10	122.24	4.86
AP-10	110.40	104.40	6.00

*The observation from LNG-MW-4 was not used in the model calibration due to inconsistency with previous measurements, so is not shown on Figure 3-17.

3.4.2 Calibrated Parameter Values

Table 5 presents the calibration values for horizontal hydraulic conductivity. The values are listed for each soil type. If multiple zones represent the same soil type, multiple entries are listed. The geometric mean value for all zones representing a given soil type is listed, along the relative rank (highest to lowest mean value). The right-most column is the expected rank for each soil. In most cases, the order is as was expected – in other words, the parameter values are consistent with what would be expected for each soil type. Note that PEST works with as many significant digits as allowed by the user; the number of significant digits indicated in this table and other tables and attachments is not an indication of the accuracy of the parameter values.

Tables 6 through 8 present the calibrated parameter values for anisotropy, specific yield, and specific storage, respectively. Most stratified-drift aquifers contain many layers with large contrasts in hydraulic conductivities, therefore are hydraulically anisotropic. Anisotropy values ranging up to approximately 500

are supported by published values (Kontis, et al, 2004). Specific yield and specific storage values are within reported ranges for the modeled lithologies (Anderson and Woessner, 1992).

Table 9 presents the calibrated parameter values related to the groups of boundary cells shown in Figure 2-6. As noted in Section 2.5.4, the flux rate multiplier parameter for well cell zone 4 (named wellfac_4) was expected to be low. This parameter went to its lower bound during the model calibration. Parameter rivfac_1, representing vertical hydraulic conductivity of the Merrimack River bed hits its upper bound of 20 m/day, reflecting the observed high degree of hydraulic connection with the valley-fill aquifer.

Attachment 2 lists all parameters established fort the model calibration, their calibrated value, the lower and upper bounds applied during calibration, and whether the parameter value was varied during the calibration.

Table 5 Calibrated Horizontal Hydraulic Conductivities by Lithology

Lithology	Horizontal hydraulic conductivity (m/day)						Geometric mean	Rank	Expected rank
CLAY	0.17						0.170	13	13
SILT	0.050	3.0					0.387	12	12
FINE SAND	30.0	30.0	15.4	30.0	1.0	30.0	15.24	7	8
FINE SAND WITH TRACE FINES	2.49	25.0	25.0	9.1			10.90	9	9
FINE SAND WITH LITTLE FINES	0.50	25.0	25.0				6.786	11	10
FINE SAND WITH SOME FINES	0.54	25.0	25.0				6.967	10	11
COARSE SAND	41.7	300.0	300.0				155.5	3	3
COARSE SAND WITH TRACE FINES	250.0	250.0					250.0	2	5
COARSE SAND WITH LITTLE FINES	20.0						20.0	6	6

3.4.3 Parameter Sensitivities

The relative sensitivity of each parameter to the calibration targets is presented in order to quantify which parameters are most sensitive to and constrained by the available observations. Sensitivities are presented in a histogram chart for the most sensitive parameters (Figure 3-19) and in Attachment 3 for all parameters. The most sensitive parameter simulates flux into the northern end of the model domain in layer 3 (Zone 12 on Figure 2-6). That zone represents flow into the model domain as underflow in the unconsolidated deposits and flow from bedrock discharging toward the Merrimack River; as noted above, available data do not allow differentiation of flow from bedrock from underflow in this part of the model domain. Other parameters that have high sensitivities are hydraulic conductivity and anisotropy values for zones near wells MVD-4/5.

4.0 Flow Model Usage

4.1 Evaluation of the Model Water Balance and Sources of Water Pumped by MVD-4/5

A summary of the MVD-4/5 Model water balance is presented in Table 10. The scenario this represents is pumping of MVD-4/5 at their long term average rates, with the river stage as observed in the 2003 aquifer testing, and recharge rate used in the model calibration (21.1 inches/yr). Simulated flow rates are expressed in gpm and in cubic feet per second (cfs). Roughly half of the groundwater in this scenario originates from recharge and half from lateral inflow into the model domain; more than 80 percent of this lateral inflow is in the layers representing the bedrock and underflow in the valley-fill aquifer from north of the model domain. At the simulated pumping rates, a relatively small fraction of the groundwater originates from induced recharge from the Merrimack River. The predominant sink for groundwater is the Merrimack River and its tributaries in the model domain. Pumpage from wells MVD-4/5 accounts for 16 percent of the simulated groundwater outflow. Pumping of wells MVD-4/5 in this scenario and the summer pumping scenario described next are simulated to induce flow from outside the model domain through the GHB cells near the Merrimack River at the south end of the model domain. Detailed flow budgets for each group of boundary cells in this scenario is presented in Attachment 4.

The simulated sources of the water pumped from MVD-4/5 at long-term average pumping rates are listed in Table 11. Wells MVD-4/5 do not capture water from the Merrimack River in this scenario. The majority of the water pumped from wells MVD-4/5 entered the aquifer as recharge west of the well field. Roughly equal amounts originate as recharge in areas north of the well field and as groundwater discharged from the bedrock to the valley-fill aquifer.

Tables 12 and 13 summarize the water balance for the groundwater flow model and the water sources for wells MVD-4/5 under summer pumping conditions. In this scenario, 12 percent of the water comes from induced recharge from the Merrimack River. As with the previous scenario, the majority of the water entered the aquifer as recharge west of the well field and roughly equal amounts, but smaller fractions, originate as recharge in areas north of the well field and as groundwater discharged from the bedrock to the valley-fill aquifer. Detailed flow budgets for each group of boundary cells in this scenario is presented in Attachment 5.

Table 14 summarize the water balance for the groundwater flow model under conditions simulated for November 2016. In this case, wells MVD-4/5 were not pumping. This scenario has a greater amount of discharge to streams due primarily to the lower stage of the Merrimack River at the time. Note the simulated outflow from the model domain through the GHB cells at the south end of the model domain. Detailed flow budgets for each group of boundary cells in this scenario is presented in Attachment 6.

Preliminary modeling on a regional scale for the CM Report produces similar water balance numbers for the portion of the regional model represented by the MVD-4/5 Model.

Table 10 Groundwater Flow Model Water Balance for the Long-term Average MVD-4/5 Pumping Rate Scenario

Sources			Sinks

4.2 Quantification of Predictive Uncertainty

A prediction of interest regarding wells MVD-4/5 is the fraction of groundwater pumped from wells MVD-4/5 that flows beneath the Longa Disposal Area (LDA). This prediction is referred to as "*lda_source*" in the discussion below. The code FlowSource (Black and Foley, 2013) was used to quantify this value based on MVD-4/5 Model output for a simulation of pumping at rates representing summer conditions. The calibrated model produced a predicted value of 1.6 percent. The uncertainty in that prediction was then tested as described below.

Similar to weather forecasting models, groundwater models have uncertainty in the predictions for which the models are designed to evaluate. The sources of uncertainty include the reliability and representativeness of the data used in the model construction and calibration, the conceptual hydrogeologic model, the degree to which the calibration data constrains the prediction, and the numerical algorithms of the modeling codes. A predictive uncertainty evaluation was performed to determine the contributions of groundwater from various areas to the MVD wells under historical operating conditions within a 95 percent confidence range.

Predictive uncertainty was performed as follows. A statistically significant increase in the objective function value is calculated that represents the 95 percent confidence limit. Any parameter set that produces this increased objective function value is inferred to be from the same population that produced the minimum objective function. The range from the minimized to the maximized prediction value is the 95 percent confidence limit on the prediction.

Pareto uncertainty analysis was conducted using the PEST software package. Detailed descriptions of this method are presented in Watermark Numerical Computing (2016) and Moore et al. (2010). The Pareto front is defined for a multi-dimensional objective function as the surface over which resources have been efficiently allocated so it is impossible to improve one component of the objective function without diminishing another. Figure 4-1 provides a visual illustration of a two-dimensional Pareto Front. Notice, that along the curve it is not possible to simultaneously improve both components of the objective function; any improvement in one component will cause a loss in the other.

Therefore, predictive uncertainty is estimated by constructing a Pareto front for the Calibration and Prediction Objective Functions and using the curve to analyze how maximizing a prediction impacts the calibration. It is generally possible to maximize a prediction up to a point without incurring an unreasonable penalty in the accuracy of the calibration (i.e. the goodness of fit between observed conditions and model-simulated conditions). However, at some point additional attempts to increase the prediction tend to drive the calibration objective function up to an unreasonable level. In other words, the model begins to simulate conditions that are not adequately supported by the observations.

For this effort, a Pareto Front was constructed for the calibration objective function and a predictive objective function that maximizes the prediction *lda_source*. The results are presented in Figure 4-2. The gaps between groups of points in the curve are indicative of local minima that were encountered in analysis. These were mitigated for by performing three separate Pareto simulations and consolidating the results. It is interesting to note that most of the increase in the calibration objective function in the upper right portion of Figure 4-2 is due to the observation group named round3 – the synoptic water level measurements taken on November 23, 2016. Figure 4-3 presents the round3 component of the objective function for the same points presented in Figure 4-2. Technically, Figure 4-3 is not a Pareto Curve because the Pareto optimization was performed on the entire calibration objective function rather than just the round3 component, but it still provides useful information in that it shows the round3 observations provide the largest constraint as the *lda_source* predictions become large.

Deciding how far to extend the uncertainty bands using the Pareto front is not straight forward; it is very difficult, if not impossible, to develop accurate statistical models for the calibration error of environmental models because the error is typically dominated by structural errors that are not caused by random parameter variation rather than randomly-varying measurement errors. Doherty and Welter (2005) provide an in-depth discussion of the effects of structural error and Beven (2009; 2013) warns about the dangers of assuming all errors can be treated as random numbers. Doherty and Welter (2005) conclude that it is necessary to use professional judgment to evaluate the performance of environmental models and Beven (2009; 2013) introduces the concept of equifinality (the concept that many models of a system may be acceptably consistent with the available observations), which is based on a less formal concept of limits of acceptability rather than more formal statistical testing of a model hypothesis. Given these inherent limitations, the uncertainty bounds for this project were established by reviewing the calibration metrics and plots to determine an appropriate cut-off value for the calibration objective function.

The following equation is used with models in which far more observations are available than adjustable parameters to calculate an increase in the objective function (δ) beyond which the model is considered uncalibrated (Watermark Numerical Computing, 2005). This calculation is based on the minimized objective function value (Φ_{min}), number of observations and articles of prior information available to constrain the calibration (m), and the number of parameters allowed to vary in the calibration (n). The F-distribution is used with a specified confidence (α).

$$\delta = n\frac{\Phi_{min}}{m-n}F_{\alpha}(n, m-n)$$

Applying this equation to the calibration result, an objective function in the range of 125 to 130 approximates the 95 percent confidence level. The results in Figure 4-2 indicate that, at most, approximately 15 percent of the water pumped by wells MVD-4/5 under summer pumping conditions passes beneath the LDA in flowing to wells MVD-4/5. When pumping rates are lower (i.e. when summer watering demands are no longer a factor), the contribution of groundwater flow from under the landfill to wells MVD-4/5 is considerably less.

The Pareto method was not effective in finding the lower limit on the prediction. The lower limit may be as low as zero.

4.3 Long-term Simulation

The calibrated model was used to simulate historic pumping rates as reported by MVD using monthly stress periods representing January 1989 through February 2016. The simulation also reflects average monthly river stage for the Merrimack River (as extrapolated from Goffs Falls) and monthly variations in recharge (as calculated by SWB). These three elements constitute the primary hydrologic stresses that affect groundwater flow in the vicinity of the MVD well field. Figure 2-10 shows the variation of these model inputs throughout the simulation.

A solute tracer simulation was run to evaluate the influence of these long-term variations in river stage, recharge, and MVD-4/5 pumping rates on the amount of water pumped from MVD-4/5 that passes under the LDA. The simulation was run using MT3D-USGS (Bedekar, et al, 2016a and 2016b). MT3D-USGS uses flow and budget information from MODFLOW.

The solute tracer simulation consisted of assigning specified concentrations of 100 generic concentration units to model cells located in the footprint of the LDA in layers 1 to 3. This simulation can be thought of as a "numerical tracer test", conducted to evaluate in the model where water underneath the LDA flows to and how the flow directions and rates are affected by historical variations in pumping, recharge, and river stage.

Aside from the variations shown in Figure 2-10, the flow boundary conditions for the long-term simulation are those determined by the MVD-4/5 Model construction and calibration (Sections 2 and 3). The flow simulation is transient, with 326 month-long stress periods, each with four time steps. An

effective porosity of 0.20 was used. No decay, sorption, diffusion, or dispersion are simulated. MT3D-USGS's finite difference solver was used.

In this way, the simulated concentration at a given time and location in the model indicates the fraction of water that passed under the LDA prior to migrating to that location. This simulation is not intended to indicate the expected behavior of an actual solute in the flow system – the "solute" is a surrogate for advective groundwater flow.

Simulation results are shown on Figure 4-4, with the simulated fraction of water pumped from well MVD-5 that passed under the LDA plotted along with the model inputs that were presented on Figure 2-10. The percent of water that has passed under the LDA at the location of well MVD-5 is variable, but the results indicate that up to 3 percent of the water pumped by MVD-5 passed under the LDA. This is consistent with the model calibration result, from which the steady-state simulation of summer pumping conditions with average recharge rates and a river stage representing April 2003 conditions indicated 1.6 percent of the discharge from wells MVD-4/5 having passed under the LDA. The results also indicate that periods of lower pumping rates and other factors can reduce the amount of water produced that passed under the LDA to zero. The simulated capture zone of well MVD-5 encompasses that of well MVD-4, therefore the simulation indicates no water pumped from MVD-4 passed under the LDA.

5.0 Summary and Next Steps

As noted in Section 1, all groundwater flow models are a simplification of reality and have uncertainty related to their construction, their inputs, and, consequently, their outputs. Model fidelity reflects the degree to which a groundwater flow model is designed to resemble the physical hydrogeologic system it was developed to simulate (ASTM-D5981; ASTM, 2008). A model with relatively low computational demand was required based on the following considerations, therefore the MVD-4/5 Model was developed to the degree of a medium-fidelity model as defined in ASTM-D5981 (ASTM, 2008):

- The nature of the historical data available with which to calibrate the model. In particular, EGGI's (2003) large-scale pumping test using two, partially-penetrating wells with multiple observation wells, some located within a few feet of the pumping wells and completed at various depths within the aquifer.
- The nature of intended applications of the model, including transient simulation of monthly historic conditions from 1989 into 2016.

History-matching of the 2003 aquifer testing data from EGGI (2003) and the synoptic water level data collected during the current investigation indicate the calibrated model meets the definition of medium-fidelity model and the model is therefore a useful tool for evaluating groundwater flow to wells MVD-4/5.

An assessment was made of the uncertainty of the model prediction of the fraction of water withdrawn by wells MVD-4/5 under summer pumping conditions that passes under the Longa Disposal Area (LDA). This prediction ranges from less than 1.6 percent to approximately 15 percent.

A long-term simulation of pumping rate, recharge, and river stage variation was performed. Results from the long-term simulation, using only the calibrated model parameters, indicate that the prediction ranges from 0 to approximately 3 percent through time, depending primarily on the pumping rate of wells MVD-4/5.

It may be possible to reduce the uncertainty of the model prediction through:

- collection of additional data, such as monitoring of water level data, particularly in the LDA monitoring wells as wells MVD-4/5 are brought back online,
- installation, sampling, and monitoring of bedrock monitoring wells in to better constrain the discharge to the well field from bedrock, and
- refinement of the groundwater flow model.

However, it should be noted that unless wells MVD-4/5 are pumped at continuous rates such as those during the 2003 testing for a period of time exceeding 7 days, steady-state conditions will not be reached and estimation of the influence of pumping at the more distant monitoring wells may be difficult. Expansion of the model domain to achieve greater model fidelity would result in greater computational demand which may render some of the approaches applied in the current modeling, such as the long-term solute tracer simulation, impractical or impossible. Implementation of the higher degrees of model parameterization required to achieve greater model fidelity would introduce predictive analysis methods in which more subjectivity is involved in evaluating predictive uncertainty.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8650983, 8650984, 8650985, 8650987, 8650988, 8650989, 8650990

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8650982, 8650983, 8650985, 8650989, 8650990

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8650987

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, no reportable hits were observed.

Sample #s: 8650988

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8650984

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8650986

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, only PFHxA was observed as a reportable hit.

Batch #: 16301011 (Sample number(s): 8650982-8650990 UNSPK: 8650988)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8650982, 8650983, 8650984, 8650985, 8650986, 8650987, 8650988, 8650989, 8650990, Blank, LCS, LCSD, MS

SW-846 6010C, Metals

Batch #: 163010635003 (Sample number(s): 8650983-8650985, 8650988-8650990 UNSPK: P643058 BKG: P643058)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Calcium, Sodium

SM 2320 B-1997, Wet Chemistry

Batch #: 16302005201A (Sample number(s): 8650983-8650985, 8650988-8650990 UNSPK: P650711 BKG: P650703, P650711)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Total Alkalinity to pH 4.5

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

10954	NMeFOSAA	2355-31-9	1	U	1	3	1
	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, only PFHxA was observed as a reportable hit.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

Misc. Organics	**EPA 537 Rev. 1.1 modified**		**ng/l**		**ng/l**	**ng/l**

CAT No.	Analysis Name	CAS Number	As Received Result		As Received Method Detection Limit*	As Received Limit of Quantitation	Dilution Factor
GC/MS Volatiles	**SW-846 8260C**		**ug/l**		**ug/l**	**ug/l**	
11997	o-Xylene	95-47-6	0.5	U	0.5	1	1

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

Misc. Organics	**EPA 537 Rev. 1.1 modified**		**ng/l**		**ng/l**	**ng/l**

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 12/29/2016 10:11

Group Number: 1722616

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8656716, 8656717, 8656719

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8656715, 8656720, 8656726

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8656716, 8656717, 8656722, 8656724

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8656718

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
In the initial extraction of this trip blank sample, PFBA, PFTeDA, and PFOA were observed as reportable hits. In the re-extraction of this sample, only PFBA was observed as a reportable hit.

Sample #s: 8656723, 8656725

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8656719

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and the recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, there were no reportable hits.

Batch #: 16306001 (Sample number(s): 8656715-8656720, 8656722-8656726 UNSPK: 8656726)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8656715, 8656716, 8656717, 8656718, 8656719, 8656720, 8656722, 8656723, 8656724, 8656725, 8656726, Blank, LCS, LCSD, MS

SW-846 6010C, Metals

Batch #: 163010635003 (Sample number(s): 8656716-8656717, 8656720-8656721, 8656725-8656726 UNSPK: P643058 BKG: P643058)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Calcium, Sodium

EPA 300.0, Wet Chemistry

Batch #: 16309972602A (Sample number(s): 8656716-8656717 UNSPK: P660373 BKG: P660373)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Sulfate

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

In the initial extraction of this trip blank sample, PFBA, PFTeDA, and PFOA were observed as reportable hits. In the re-extraction of this sample, only PFBA was observed as a reportable hit.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 12/21/2016 11:51

Group Number: 1723907

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8662643, 8662646, 8662647, 8662648, 8662649, 8662650, 8662653, 8662654, 8662655

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8662644

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, only PFBA was observed as a reportable hit.

Sample #s: 8662651

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8662645

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits. The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.
In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, only PFDoA was observed as a reportable hit.

Batch #: 16306002 (Sample number(s): 8662643-8662651, 8662653-8662655 UNSPK: 8662649)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8662643, 8662644, 8662645, 8662646, 8662647, 8662648, 8662649, 8662650, 8662651, 8662653, 8662654, 8662655, Blank, LCS, MS, MSD

SM 2320 B-1997, Wet Chemistry

Batch #: 16309004201A (Sample number(s): 8662649-8662652 UNSPK: 8662649 BKG: P8662649-P664206)

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside outside acceptance windows: Total Alkalinity to pH 4.5

Batch #: 16309004203A (Sample number(s): 8662653 UNSPK: P664194 BKG: P664194, P664204)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

In the initial extraction of this trip blank sample, several parameters were observed as reportable hits. In the re-extraction of this sample, only PFBA was observed as a reportable hit.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and recoveries were within acceptable limits. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no target analytes were observed in the blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1725147
Reported: 01/04/2017 12:19

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Lancaster, PA 17601

Prepared for:

C. T. Male Associates
50 Century Hill Drive
Latham NY 12110

Report Date: January 30, 2017

Project: SGPP - Merrimack

Submittal Date: 10/28/2016
Group Number: 1726627
SDG: MMK04
PO Number: 16.6126
State of Sample Origin: NH

Client Sample Description	Lancaster Labs (LL) #
SG2-APEB01-161026 Grab Blank Water	8668861
SG2-AP06-19-161026 Grab Groundwater	8668862
SG2-AP06-29-161026 Grab Groundwater	8668863
SG2-AP06-39-161026 Grab Groundwater	8668864
SG2-AP06-49-161026 Grab Groundwater	8668865
SG2-AP06-59-161027 Grab Groundwater	8668866
SG2-LTB01-161027 Blank Water	8668867
SG2-FTB01-161027 Grab Blank Water	8668868
SG2-AP06-68-161027 Grab Groundwater	8668869
SG2-AP06-73-161027 Grab Groundwater	8668870
SG2-APEB01-161027 Grab Blank Water	8668871

The specific methodologies used in obtaining the enclosed analytical results are indicated on the Laboratory Sample Analysis Record.

Regulatory agencies do not accredit laboratories for all methods, analytes, and matrices. Our current scopes of accreditation can be viewed at http://www.eurofinsus.com/environment-testing/laboratories/eurofins-lancaster-laboratories-environmental/resources/certifications/ . To request copies of prior scopes of accreditation, contact your project manager.

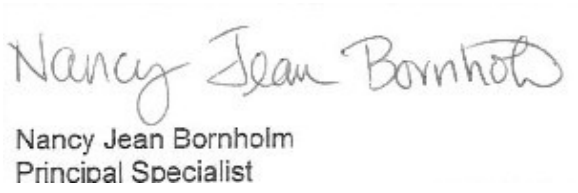
REVISED

Respectfully Submitted,



Nancy Jean Bornholm
Principal Specialist

(717) 556-7250

Project Name: SGPP - Merrimack
LL Group #: 1726627

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8668871
A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8668861, 8668862, 8668863, 8668864, 8668865, 8668866, 8668867, 8668868, 8668869, 8668870, 8668871
The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 16314003 (Sample number(s): 8668861-8668871 UNSPK: 8668870)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Perfluorotridecanoic acid

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8668861, 8668862, 8668867, 8668870, 8668871, Blank, LCSD

EPA 300.0, Wet Chemistry

Sample #s: 8668871
Sample was originally analyzed within the 28 day holding time, however the result exceeded the calibration range. Sample was reanalyzed at a greater dilution past hold on 12/01/2016 with a result of 22.5 mg/l.

Sample #s: 8668871
Smple was analyzed in duplicate to comfirm the result.

Batch #: 16315120601B (Sample number(s): 8668862-8668866, 8668869-8668871 UNSPK: 8668862 BKG: 8668862)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Chloride

SM 2320 B-1997, Wet Chemistry

Sample #s: 8668871

This sample was analyzed for alkalinity on 11/01/16 and yielded a result of 26.9 mg/L as CaCO3. The sample was repeat for alkalinity on 11/08/16 and yielded a result of 25.7 mg/L as CaCO3, confirming the inital result.

Batch #: 16305006203A (Sample number(s): 8668862-8668866, 8668869, 8668871 UNSPK: P668954 BKG: P668870, P668954)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

Batch #: 16305006203B (Sample number(s): 8668870 UNSPK: P668954 BKG: P8668870-P668954)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

11997	o-Xylene	95-47-6	0.5	U	0.5	1	1
	A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.						
00882	**VOA Library Search**						
	The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

FORM I VOA-TIC

REVISED

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1726627
Reported: 01/30/2017 13:27

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8670454, 8670455, 8670457, 8670458

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8670456

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8670457

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
Target analyte(s) was detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no reportable hits were observed in the method blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8670458

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
Target analyte(s) was detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no reportable hits were observed in the method blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Batch #: 16316001 (Sample number(s): 8670454-8670458 UNSPK: 8670457)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8670456, 8670457, 8670458, MS

SW-846 6010C, Metals

Batch #: 163090635001 (Sample number(s): 8670454, 8670457-8670458 UNSPK: P677168 BKG: P677168)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Calcium, Magnesium

EPA 300.0, Wet Chemistry

Batch #: 16315120601B (Sample number(s): 8670454, 8670457 UNSPK: P668862 BKG: P668862)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Chloride

SM 2320 B-1997, Wet Chemistry

Batch #: 16312002102B (Sample number(s): 8670458 UNSPK: P670613 BKG: P8670458-P670613)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Total Alkalinity to pH 4.5

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

Misc. Organics	**EPA 537 Rev. 1.1 modified**		**ng/l**		**ng/l**	**ng/l**

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analyte(s) was detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no reportable hits were observed in the method blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analyte(s) was detected in the method blank associated with the samples as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and no reportable hits were observed in the method blank. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1726931
Reported: 12/30/2016 15:16

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8679411

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected and comparable results were observed.
The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8679407, 8679409, 8679410, 8679413, 8679414

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 16321006 (Sample number(s): 8679406-8679414 UNSPK: 8679407)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8679407, 8679409, 8679410, 8679411, 8679413, 8679414, MSD

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected and comparable results were observed.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 01/04/2017 11:25

Group Number: 1729119

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

LL Group #: 1729126

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8679494, 8679495, 8679496, 8679497

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8679492

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Batch #: 16318002 (Sample number(s): 8679489-8679494 UNSPK: 8679493)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8679489, 8679492, 8679494, MS

Batch #: 16321006 (Sample number(s): 8679495-8679497 UNSPK: P679407)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8679495, 8679496, 8679497, MSD

EPA 353.2, Wet Chemistry

Batch #: 16314118104B (Sample number(s): 8679492-8679493, 8679495-8679497 UNSPK: 8679492 BKG: 8679492)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 16316002105A (Sample number(s): 8679489, 8679492-8679493 UNSPK: P688452 BKG: P688452, P688845)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

Batch #: 16316002106A (Sample number(s): 8679495-8679496 UNSPK: 8679496 BKG: P8679496-P679497)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

Batch #: 16316002106B (Sample number(s): 8679497 UNSPK: P679496 BKG: P679496, P8679497)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

Sample Comments

The metals container was received at a pH of 5. After receipt the pH was adjusted to < 2.

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

	The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.						
	The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

FORM I VOA-TIC

REVISED

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1729126
Reported: 01/30/2017 13:27

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8682717, 8682722

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8682718

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
Target analytes were detected in this trip blank. The following corrective action was taken: the sample was re-extracted outside of the required holding time and a reportable hit was detected for PFOA. The data is reported from the initial in-hold extraction of the sample. Both sets of data are available in the data package.

Sample #s: 8682715, 8682716, 8682719, 8682720, 8682721, 8682723, 8682724

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Sample #s: 8682726

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.
Target analytes were detected in this rinse blank. The following corrective action was taken: the sample was re-extracted outside of the required holding time and comparable hits were detected.
The data is reported from the initial in-hold extraction of the sample. Both sets of data are available in the data package.

Batch #: 16321007 (Sample number(s): 8682715-8682724, 8682726 UNSPK: 8682722)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8682715, 8682716, 8682719, 8682720, 8682721, 8682723, 8682724, 8682726, LCS, MS, MSD

EPA 353.2, Wet Chemistry

Batch #: 16321118102A (Sample number(s): 8682719 UNSPK: P687845 BKG: P687845)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 16319006204B (Sample number(s): 8682720 UNSPK: P682722 BKG: P8682720-P682722)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Target analytes were detected in this trip blank. The following corrective action was taken: the sample was re-extracted outside of the required holding time and a reportable hit was detected for PFOA. The data is reported from the initial in-hold extraction of the sample. Both sets of data are available in the data package.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary. The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed. The data is reported from the in-hold extraction. Both sets of data are included in the data package.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample labeled compound(s) used as extraction standards is outside the QC acceptance limits as noted on the QC Summary.
The following corrective action was taken: The sample was reextracted outside the holding time and comparable results were observed.
The data is reported from the in-hold extraction. Both sets of data are included in the data package.

Target analytes were detected in this rinse blank. The following corrective action was taken: the sample was re-extracted outside of the required holding time and comparable hits were detected.
The data is reported from the initial in-hold extraction of the sample.
Both sets of data are available in the data package.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1729841
Reported: 01/04/2017 14:13

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8687827, 8687828, 8687829, 8687830, 8687831, 8687832, 8687833, 8687835, 8687836, 8687838, 8687839, 8687841, 8687843, 8687844, 8687845, 8687846

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8687840

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample internal standard is outside the QC acceptance limits.
Target analytes were detected in this rinse blank. The following corrective action was taken: the sample was re-extracted outside of the required hoding time and no reportable hits were detected. the data is reported from the initial in-hold extraction of the sample. Both sets of data are available in the data package.

Sample #s: 8687837, 8687842

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected outside of the required holding time and all internal standards were within QC accpetance limits. The data is reported from the initial injection of the sample. Both sets of data are available in the data package.

Batch #: 16322013 (Sample number(s): 8687827-8687833, 8687835-8687846 UNSPK: 8687831)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Perfluorododecanoic acid, Perfluorotetradecanoic acid, Perfluorohexanoic acid

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8687827, 8687828, 8687829, 8687830, 8687831, 8687832, 8687833, 8687835, 8687836, 8687837, 8687838, 8687839, 8687840, 8687841, 8687842, 8687843, 8687844, 8687845, 8687846, Blank, LCS, MS, MSD

EPA 300.0, Wet Chemistry

Batch #: 16323120121B (Sample number(s): 8687827-8687828, 8687845-8687846 UNSPK: 8687827 BKG: 8687827)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Chloride, Sulfate

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Chloride, Sulfate

EPA 353.2, Wet Chemistry

Batch #: 16321118101B (Sample number(s): 8687827-8687832, 8687834-8687835, 8687838-8687839, 8687842, 8687844 UNSPK: 8687831 BKG: 8687831)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Nitrite/Nitrate Nitrogen

Batch #: 16321118102A (Sample number(s): 8687845-8687846 UNSPK: 8687845 BKG: 8687845)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 16321002202A (Sample number(s): 8687830, 8687839 UNSPK: P688635 BKG: P688635, P688637)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

Batch #: 16321005106A (Sample number(s): 8687827, 8687829, 8687831-8687835, 8687838, 8687844-8687845 UNSPK: 8687831 BKG: P687605, P8687831)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected outside of the required holding time and all internal standards were within QC accpetance limits. The data is reported from the initial injection of the sample. Both sets of data are available in the data package.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample internal standard is outside the QC acceptance limits.

Target analytes were detected in this rinse blank. The following corrective action was taken: the sample was re-extracted outside of the required hoding time and no reportable hits were detected. the data is reported from the initial in-hold extraction of the sample. Both sets of data are available in the data package.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1731052
Reported: 01/25/2017 13:54

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Analysis Report

REVISED

ANALYTICAL RESULTS

Prepared by:

Eurofins Lancaster Laboratories Environmental
2425 New Holland Pike
Lancaster, PA 17601

Prepared for:

C. T. Male Associates
50 Century Hill Drive
Latham NY 12110

Report Date: January 30, 2017

Project: SGPP - Merrimack

Submittal Date: 11/12/2016
Group Number: 1732744
SDG: MMK10
PO Number: 16.6126
State of Sample Origin: NH

Client Sample Description	Lancaster Labs (LL) #
SG2-LTB01-161111 Blank Water	8695116
SG2-FTB01-161111 Blank Water	8695117
SG2-LNGMW-2-161111 Grab Groundwater	8695118
SG2-MER45-11-161111 Grab Groundwater	8695119

The specific methodologies used in obtaining the enclosed analytical results are indicated on the Laboratory Sample Analysis Record.

Regulatory agencies do not accredit laboratories for all methods, analytes, and matrices. Our current scopes of accreditation can be viewed at http://www.eurofinsus.com/environment-testing/laboratories/eurofins-lancaster-laboratories-environmental/resources/certifications/ . To request copies of prior scopes of accreditation, contact your project manager.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8695116, 8695117, 8695118, 8695119

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 16327003 (Sample number(s): 8695116-8695119 UNSPK: P697075)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8695116, 8695117, 8695118, 8695119, Blank, LCS, MS, MSD

EPA 300.0, Wet Chemistry

Batch #: 16330987171B (Sample number(s): 8695118-8695119 UNSPK: P693356 BKG: P693356)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Chloride, Sulfate

EPA 353.2, Wet Chemistry

Batch #: 16323118103A (Sample number(s): 8695118-8695119 UNSPK: P693363 BKG: P693363)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 16326010102A (Sample number(s): 8695119 UNSPK: P697075 BKG: P697075, P697666)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

FORM I VOA-TIC

REVISED

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1732744
Reported: 01/30/2017 13:32

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Batch #: Y163263AA (Sample number(s): 8695122-8695128 UNSPK: P699736)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Carbon Disulfide

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8695120, 8695121, 8695122, 8695123, 8695125, 8695126, 8695127, 8695128

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8695124

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken:
The sample was reinjected and comparable results were observed.

Batch #: 16323001 (Sample number(s): 8695120-8695128 UNSPK: P695182)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Perfluoroheptanoic acid, Perfluoro-octanesulfonate

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8695120, 8695121, 8695122, 8695123, 8695124, 8695125, 8695126, 8695127, 8695128, Blank, LCS, MS, MSD

EPA 353.2, Wet Chemistry

Batch #: 16323118103A (Sample number(s): 8695120 UNSPK: P693363 BKG: P693363)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

Batch #: 16325118101B (Sample number(s): 8695127 UNSPK: P697075 BKG: P697075)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 16321005103A (Sample number(s): 8695120, 8695122-8695124, 8695126 UNSPK: P690739 BKG: P690739, P691182)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Total Alkalinity to pH 4.5

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates Group Number: 1732745
Reported: 01/04/2017 16:35

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Sample Administration Receipt Documentation Log

Doc Log ID: 167836

Group Number(s): 1732745

Client: C.T. Male

Delivery and Receipt Information

Delivery Method:	Fed Ex	Arrival Timestamp:	11/10/2016 9:30
Number of Packages:	3	Number of Projects:	1
State/Province of Origin:	NH		

Arrival Condition Summary

Shipping Container Sealed:	Yes	Sample IDs on COC match Containers:	Yes
Custody Seal Present:	Yes	Sample Date/Times match COC:	Yes
Custody Seal Intact:	Yes	VOA Vial Headspace ≥ 6mm:	No
Samples Chilled:	Yes	Total Trip Blank Qty:	3
Paperwork Enclosed:	Yes	Trip Blank Type:	See Below
Samples Intact:	Yes	Air Quality Samples Present:	No
Missing Samples:	No		
Extra Samples:	No		
Discrepancy in Container Qty on COC:	No		

Trip Blank Type(s): 2 HCL, 1 Unpreserved 250mL plastic bottle

Unpacked by Timothy Cubberley (6520) at 14:01 on 11/10/2016

Samples Chilled Details

Thermometer Types: DT = Digital (Temp. Bottle) IR = Infrared (Surface Temp) All Temperatures in °C.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8695186

The referenced method allows a maximum of 20% of the analytes in the calibration to exceed the 20% Drift continuing calibration verification criteria. The reported concentration in the associated sample(s) is considered to be estimated. Therefore the result for the following analyte(s) is estimated: Tetrachloroethene.

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8695178, 8695179, 8695180, 8695181, 8695182, 8695183, 8695184, 8695186, 8695187, 8695188, 8695189

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 16323001 (Sample number(s): 8695178-8695184, 8695186-8695189 UNSPK: 8695182)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Perfluoroheptanoic acid, Perfluoro-octanesulfonate

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8695178, 8695179, 8695180, 8695181, 8695182, 8695183, 8695184, 8695186, 8695187, 8695188, 8695189, Blank, LCS, MS, MSD

SM 2320 B-1997, Wet Chemistry

Batch #: 16326010102A (Sample number(s): 8695181, 8695189 UNSPK: P697075 BKG: P697075, P697666)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

	The referenced method allows a maximum of 20% of the analytes in the calibration to exceed the 20% Drift continuing calibration verification criteria. The reported concentration in the associated sample(s) is considered to be estimated. Therefore the result for the following analyte(s) is estimated: Tetrachloroethene.						
00882	**VOA Library Search**						
	The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1732751
Reported: 01/05/2017 10:50

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8697066, 8697067, 8697068, 8697069, 8697070, 8697071, 8697072, 8697073, 8697074, 8697075, 8697076, 8697077, 8697079

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 16327003 (Sample number(s): 8697066-8697077, 8697079 UNSPK: 8697075)

The recovery(ies) for the following analyte(s) in the LCS were below the acceptance window: NEtFOSAA

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: NEtFOSAA, NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8697066, 8697067, 8697068, 8697069, 8697070, 8697071, 8697072, 8697073, 8697074, 8697075, 8697076, 8697077, 8697079, Blank, LCS, MS, MSD

EPA 300.0, Wet Chemistry

Batch #: 16331972171A (Sample number(s): 8697067-8697070, 8697072-8697076, 8697078-8697079 UNSPK: 8697075 BKG: 8697075)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Chloride

EPA 353.2, Wet Chemistry

Batch #: 16325118101B (Sample number(s): 8697067-8697070, 8697072-8697076, 8697078-8697079 UNSPK: 8697075 BKG: 8697075)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 16326010102A (Sample number(s): 8697075-8697078 UNSPK: 8697075 BKG: P8697075-P697666)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

FORM I VOA-TIC

REVISED

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1733211
Reported: 01/30/2017 13:32

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

EPA 537 Rev 1.1, Misc. Organics

Sample #s: 8787450

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected and similar recoveries were observed for the internal standards.

Batch #: 17018004 (Sample number(s): 8787450 UNSPK: P787485)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8787450, Blank, LCS, LCSD, MS

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8787481
The referenced method allows a maximum of 20% of the analytes in the calibration to exceed the 20% Drift continuing calibration verification criteria. The reported concentration in the associated sample(s) is considered to be estimated. Therefore the result for the following analyte(s) is estimated: acetone.

EPA 537 Rev 1.1, Misc. Organics

Sample #s: 8787481, 8787485, 8787487, 8787489, 8787491, 8787492, 8787493, 8787494, 8787495, 8787498, 8787499, 8787500
The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8787483
The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected and internal standard recoveries were again outside of the QC acceptance limits.

Batch #: 17018004 (Sample number(s): 8787481, 8787483, 8787485, 8787487, 8787489, 8787491-8787496, 8787498-8787500 UNSPK: 8787485)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8787481, 8787483, 8787485, 8787487, 8787489, 8787491, 8787492, 8787493, 8787494, 8787495, 8787498, 8787499, 8787500, Blank, LCS, LCSD, MS

EPA 353.2, Wet Chemistry

Batch #: 17019118102B (Sample number(s): 8787496 UNSPK: P787996 BKG: P787996)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SM 2320 B-1997, Wet Chemistry

Batch #: 17017012201A (Sample number(s): 8787481, 8787489, 8787493, 8787496 UNSPK: P787311 BKG: P787311, P787332)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

	The referenced method allows a maximum of 20% of the analytes in the calibration to exceed the 20% Drift continuing calibration verification criteria. The reported concentration in the associated sample(s) is considered to be estimated. Therefore the result for the following analyte(s) is estimated: acetone.

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

The recovery for the sample internal standard is outside the QC acceptance limits. The following corrective action was taken: the sample was reinjected and internal standard recoveries were again outside of the QC acceptance limits.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1754381
Reported: 02/17/2017 14:33

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Sample #s: 8799394

A Method Detection Limit (MDL) standard is analyzed to confirm sensitivity of the instrument for samples with non-detect analytes associated with a continuing calibration verification standard exhibiting low response (outside the 20%D criteria). The MDL standard shows adequate sensitivity at or below the reporting limit.

Batch #: A170272AA (Sample number(s): 8799393, 8799399-8799401 UNSPK: 8799399)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: 1,2-Dibromo-3-chloropropane, 2-Hexanone

EPA 537 Rev 1.1, Misc. Organics

Sample #s: 8799385, 8799386, 8799387, 8799388, 8799389, 8799390, 8799395, 8799397, 8799398, 8799403

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17031006 (Sample number(s): 8799385-8799391, 8799395, 8799397-8799398, 8799403 UNSPK: 8799385)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Perfluorohexanoic acid

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8799385, 8799386, 8799388, 8799389, 8799390, 8799395, 8799397, 8799398, 8799403, Blank, LCS, MS

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8799393, 8799394, 8799399, 8799400, 8799401

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17024006 (Sample number(s): 8799393-8799394, 8799399-8799401 UNSPK: 8799399)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: NEtFOSAA, NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8799393, 8799394, 8799399, 8799400, 8799401, LCS, MS, MSD

EPA 353.2, Wet Chemistry

Batch #: 17029118102A (Sample number(s): 8799385, 8799388-8799391, 8799395 UNSPK: 8799385 BKG: 8799385)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SW-846 9060 modified, Wet Chemistry

Sample #s: 8799393, 8799394, 8799399

Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.

SM 2320 B-1997, Wet Chemistry

Batch #: 17025008103A (Sample number(s): 8799388, 8799391 UNSPK: P798607 BKG: P797952, P798607)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Total Alkalinity to pH 4.5

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside outside acceptance windows: Total Alkalinity to pH 4.5

Batch #: 17025008104A (Sample number(s): 8799385, 8799389, 8799395 UNSPK: P798933 BKG: P798933, P799390)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

Batch #: 17025008104B (Sample number(s): 8799390 UNSPK: P798933 BKG: P798933, P8799390)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Alkalinity to pH 4.5

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1757183
Reported: 02/07/2017 10:47

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Batch #: A170272AA (Sample number(s): 8799404-8799408 UNSPK: P799399)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: 1,2-Dibromo-3-chloropropane, 2-Hexanone

EPA 537 Rev 1.1, Misc. Organics

Sample #s: 8799415, 8799417

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Sample #s: 8799409, 8799411, 8799412, 8799414

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.
The recovery of the extraction standard E13C3-PFHxS was outside QC acceptance criteria at 132% in the opening CCV associated with this sample. Since the recovery of the E13C3-PFHxS was within acceptance criteria in the sample, the data is reported.

Batch #: 17030004 (Sample number(s): 8799409, 8799411-8799412, 8799414-8799417 UNSPK: 8799414)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8799409, 8799411, 8799412, 8799414, 8799415, 8799417, Blank, LCS, MS

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8799404, 8799405, 8799406, 8799407, 8799408

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17024006 (Sample number(s): 8799404-8799408 UNSPK: P799399)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: NEtFOSAA, NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8799404, 8799405, 8799406, 8799407, 8799408, LCS, MS, MSD

EPA 353.2, Wet Chemistry

Batch #: 17029118102A (Sample number(s): 8799409, 8799411-8799412, 8799417 UNSPK: P799385 BKG: P799385)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

SW-846 9060 modified, Wet Chemistry

Sample #s: 8799405, 8799406, 8799407, 8799408

Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.

Batch #: 17024667631B (Sample number(s): 8799408 UNSPK: P799432 BKG: P799432)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: TOC Solids/Sludges Combustion

SM 2320 B-1997, Wet Chemistry

Batch #: 17025008103A (Sample number(s): 8799411 UNSPK: P798607 BKG: P797952, P798607)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Total Alkalinity to pH 4.5

The relative percent difference(s) for the following analyte(s) in the MS/MSD were outside outside acceptance windows: Total Alkalinity to pH 4.5

Batch #: 17025008104A (Sample number(s): 8799412, 8799414, 8799417 UNSPK: P798933 BKG: P798933, P799390)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

Batch #: 17026002103A (Sample number(s): 8799409 UNSPK: P804238 BKG: P804217, P804238)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

	The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.						
Wet Chemistry	**SW-846 9060 modified**		**mg/kg**		**mg/kg**	**mg/kg**	
02079	TOC	n.a.	197	U	197	592	1
	Due to the nature of this sample matrix, the sample cup was filled to capacity with less than 1000 mg of sample being used. The lowered sample weight has resulted in a raised reporting limit.						
Wet Chemistry	**SM 2540 G-1997**		**%**		**%**	**%**	
00111	Moisture	n.a.	7.3		0.50	0.50	1
	Moisture represents the loss in weight of the sample after oven drying at 103 - 105 degrees Celsius. The moisture result reported is on an as-received basis.						

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

	NEtFOSAA is the acronym for N-ethyl perfluorooctanesulfonamidoacetic Acid.						
10954	NMeFOSAA	2355-31-9	1	U	1	3	1
	NMeFOSAA is the acronym for N-methyl perfluorooctanesulfonamidoacetic Acid.						
	The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.						
	The recovery of the extraction standard E13C3-PFHxS was outside QC acceptance criteria at 132% in the opening CCV associated with this sample. Since the recovery of the E13C3-PFHxS was within acceptance criteria in the sample, the data is reported.

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1757184
Reported: 02/07/2017 12:57

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

<	less than
>	greater than
ppm	parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.
ppb	parts per billion
Dry weight basis	Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Batch #: A170272AA (Sample number(s): 8799432-8799436 UNSPK: P799399)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: 1,2-Dibromo-3-chloropropane, 2-Hexanone

EPA 537 Rev 1.1, Misc. Organics

Sample #s: 8799425, 8799427, 8799428, 8799429, 8799431

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17030004 (Sample number(s): 8799425, 8799427-8799429, 8799431 UNSPK: P799414)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8799425, 8799427, 8799429, 8799431, Blank, LCS, MS

EPA 537 Rev. 1.1 modified, Misc. Organics

Sample #s: 8799432, 8799433, 8799434, 8799435, 8799436

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17024006 (Sample number(s): 8799432-8799436 UNSPK: P799399)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: NEtFOSAA, NMeFOSAA

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8799432, 8799433, 8799434, 8799435, 8799436, LCS, MS, MSD

SW-846 6010C, Metals

Batch #: 170260635002 (Sample number(s): 8799425-8799430 UNSPK: 8799428 BKG: 8799428)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Calcium

SW-846 6010C, Metals Dissolved

Batch #: 170260635002 (Sample number(s): 8799425-8799430 UNSPK: 8799428 BKG: 8799428)

The recovery(ies) for the following analyte(s) in the MS and/or MSD was outside the acceptance window: Calcium

SW-846 9060 modified, Wet Chemistry

Batch #: 17024667631B (Sample number(s): 8799432-8799436 UNSPK: 8799432 BKG: 8799432)

The duplicate RPD for the following analyte(s) exceeded the acceptance window: TOC Solids/Sludges Combustion

SM 2320 B-1997, Wet Chemistry

Batch #: 17025008104A (Sample number(s): 8799425, 8799427-8799429 UNSPK: P798933 BKG: P798933, P799390)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Alkalinity to pH 4.5

00882 VOA Library Search

The results from the volatile library search are listed on the attached FORM 1 - VOA-TIC. The qualifiers appearing in the "Q" column are defined on the back of this form.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Reported: 02/07/2017 11:24

Group Number: 1757186

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

Trip Blank VOCs Water	8805606

The specific methodologies used in obtaining the enclosed analytical results are indicated on the Laboratory Sample Analysis Record.

Regulatory agencies do not accredit laboratories for all methods, analytes, and matrices. Our current scopes of accreditation can be viewed at http://www.eurofinsus.com/environment-testing/laboratories/eurofins-lancaster-laboratories-environmental/resources/certifications/ . To request copies of prior scopes of accreditation, contact your project manager.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

SW-846 8260C, GC/MS Volatiles

Batch #: Y170322AA (Sample number(s): 8805593-8805597, 8805603, 8805606)

The recovery(ies) for the following analyte(s) in the LCS and/or LCSD exceeded the acceptance window indicating a positive bias: Acetone

EPA 537 Rev 1.1, Misc. Organics

Sample #s: 8805593, 8805594, 8805595, 8805596, 8805597, 8805598, 8805599, 8805601, 8805602, 8805603, 8805605

The stated QC limits are advisory only until sufficient data points can be obtained to calculate statistical limits.

Batch #: 17027007 (Sample number(s): 8805593-8805603, 8805605 UNSPK: 8805593)

The recovery(ies) for one or more surrogates were outside of the QC window for sample(s) 8805593, 8805594, 8805595, 8805596, 8805597, 8805598, 8805599, 8805601, 8805602, 8805603, 8805605, Blank, LCS, MS

EPA 300.0, Wet Chemistry

Batch #: 17027987601A (Sample number(s): 8805597, 8805603 UNSPK: P806927 BKG: P806927)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Sulfate

EPA 353.2, Wet Chemistry

Batch #: 17034118101A (Sample number(s): 8805593-8805597, 8805603 UNSPK: 8805593 BKG: 8805593)

The recovery(ies) for the following analyte(s) in the MS was outside the acceptance window: Total Nitrite/Nitrate Nitrogen

The duplicate RPD for the following analyte(s) exceeded the acceptance window: Total Nitrite/Nitrate Nitrogen

FORM I VOA-TIC

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1758641
Reported: 02/17/2017 10:10

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

Method Blank

Analysis Name	Result		MDL**	LOQ

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

General Comments:

See the Laboratory Sample Analysis Record section of the Analysis Report for the method references.

All QC met criteria unless otherwise noted in an Analysis Specific Comment below. Refer to the QC Summary for specific values and acceptance criteria.

Project specific QC samples are not included in this data set

Matrix QC may not be reported if site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

Surrogate recoveries (if applicable) which are outside of the QC window are confirmed unless attributed to a dilution or otherwise noted in an Analysis Specific Comment below.

The samples were received at the appropriate temperature and in accordance with the chain of custody unless otherwise noted.

Analysis Specific Comments:

No additional comments are necessary.

Sample Comments

All QC is compliant unless otherwise noted. Please refer to the Quality Control Summary for overall QC performance data and associated samples.

Laboratory Sample Analysis Record

CAT No.	Analysis Name	Method	Trial#	Batch#	Analysis Date and Time	Analyst	Dilution Factor
07103	Grain Size to 1 um	ASTM D422-63 (reapproved 2007)	1	17027710301A	01/27/2017 10:00	Joshua Trost	1

*=This limit was used in the evaluation of the final result

Quality Control Summary

Client Name: C. T. Male Associates
Group Number: 1758664
Reported: 02/06/2017 10:03

Matrix QC may not be reported if insufficient sample or site-specific QC samples were not submitted. In these situations, to demonstrate precision and accuracy at a batch level, a LCS/LCSD was performed, unless otherwise specified in the method.

All Inorganic Initial Calibration and Continuing Calibration Blanks met acceptable method criteria unless otherwise noted on the Analysis Report.

*- Outside of specification
**-This limit was used in the evaluation of the final result for the blank
(1) The result for one or both determinations was less than five times the LOQ.
(2) The unspiked result was more than four times the spike added.
P###### is indicative of a Background or Unspiked sample that is batch matrix QC and was not performed using a sample from this submission group.

Explanation of Symbols and Abbreviations

The following defines common symbols and abbreviations used in reporting technical data:

BMQL	Below Minimum Quantitation Level	**mg**	milligram(s)
C	degrees Celsius	**mL**	milliliter(s)
cfu	colony forming units	**MPN**	Most Probable Number
CP Units	cobalt-chloroplatinate units	**N.D.**	none detected
F	degrees Fahrenheit	**ng**	nanogram(s)
g	gram(s)	**NTU**	nephelometric turbidity units
IU	International Units	**pg/L**	picogram/liter
kg	kilogram(s)	**RL**	Reporting Limit
L	liter(s)	**TNTC**	Too Numerous To Count
lb.	pound(s)	**µg**	microgram(s)
m3	cubic meter(s)	**µL**	microliter(s)
meq	milliequivalents	**umhos/cm**	micromhos/cm

< less than

> greater than

ppm parts per million - One ppm is equivalent to one milligram per kilogram (mg/kg) or one gram per million grams. For aqueous liquids, ppm is usually taken to be equivalent to milligrams per liter (mg/l), because one liter of water has a weight very close to a kilogram. For gases or vapors, one ppm is equivalent to one microliter per liter of gas.

ppb parts per billion

Dry weight basis Results printed under this heading have been adjusted for moisture content. This increases the analyte weight concentration to approximate the value present in a similar sample without moisture. All other results are reported on an as-received basis.

Laboratory Data Qualifiers:

C - Result confirmed by reanalysis
E - Concentration exceeds the calibration range
J (or G, I, X) - estimated value ≥ the Method Detection Limit (MDL or DL) and < the Limit of Quantitation (LOQ or RL)
P - Concentration difference between the primary and confirmation column >40%. The lower result is reported.
U - Analyte was not detected at the value indicated
V - Concentration difference between the primary and confirmation column >100%. The reporting limit is raised due to this disparity and evident interference…
W - The dissolved oxygen uptake for the unseeded blank is greater than 0.20 mg/L.

Additional Organic and Inorganic CLP qualifiers may be used with Form 1 reports as defined by the CLP methods.
Qualifiers specific to Dioxin/Furans and PCB Congeners are detailed on the individual Analysis Report.

Analytical test results meet all requirements of the associated regulatory program (i.e., NELAC (TNI), DoD, and ISO 17025) unless otherwise noted under the individual analysis.

Measurement uncertainty values, as applicable, are available upon request.

Tests results relate only to the sample tested. Clients should be aware that a critical step in a chemical or microbiological analysis is the collection of the sample. Unless the sample analyzed is truly representative of the bulk of material involved, the test results will be meaningless. If you have questions regarding the proper techniques of collecting samples, please contact us. We cannot be held responsible for sample integrity, however, unless sampling has been performed by a member of our staff.

This report shall not be reproduced except in full, without the written approval of the laboratory.

Times are local to the area of activity. Parameters listed in the 40 CFR Part 136 Table II as “analyze immediately” are not performed within 15 minutes.

WARRANTY AND LIMITS OF LIABILITY - In accepting analytical work, we warrant the accuracy of test results for the sample as submitted. THE FOREGOING EXPRESS WARRANTY IS EXCLUSIVE AND IS GIVEN IN LIEU OF ALL OTHER WARRANTIES, EXPRESSED OR IMPLIED. WE DISCLAIM ANY OTHER WARRANTIES, EXPRESSED OR IMPLIED, INCLUDING A WARRANTY OF FITNESS FOR PARTICULAR PURPOSE AND WARRANTY OF MERCHANTABILITY. IN NO EVENT SHALL EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL, LLC BE LIABLE FOR INDIRECT, SPECIAL, CONSEQUENTIAL, OR INCIDENTAL DAMAGES INCLUDING, BUT NOT LIMITED TO, DAMAGES FOR LOSS OF PROFIT OR GOODWILL REGARDLESS OF (A) THE NEGLIGENCE (EITHER SOLE OR CONCURRENT) OF EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL AND (B) WHETHER EUROFINS LANCASTER LABORATORIES ENVIRONMENTAL HAS BEEN INFORMED OF THE POSSIBILITY OF SUCH DAMAGES. We accept no legal responsibility for the purposes for which the client uses the test results. No purchase order or other order for work shall be accepted by Eurofins Lancaster Laboratories Environmental which includes any conditions that vary from the Standard Terms and Conditions, and Eurofins Lancaster Laboratories Environmental hereby objects to any conflicting terms contained in any acceptance or order submitted by client.

LOG OF BORING AP09

Project:SGPP - Merrimack MVD 4/5
Project No.:32421001.01 NH2 002
Location:Merrimack, NH
Coordinates:UTM 19N N:297336.9m, E:4750058.2m
Datum:H:NAD83, V:NAVD88

Surface Elevation:137.6 ft
Drilling Method:Hand Auger/Geoprobe
Sampling Method:Hand Auger/Direct Push
Completion Depth:35.0 ft

Depth, feet	Sample Type & Recovery	Sample No.	ENVIRONMENTAL DATA	Graphic Log	LITHOLOGIC DESCRIPTION	Elevation, feet
20.0			**G/S/F:**0%/ 98%/ 2%		Light gray fine SAND; trace Silt and Clay; saturated.	117.5
					At 20.4 feet, 2-inch thick lens of light brownish gray CLAY.	
					From 20.7 to 21.0 feet, red discoloration due to iron oxidation.	
			PID:0.5			
			D/O/S: None/ None/ None			
22.5					From 22.1 to 23.1 feet, red discoloration due to iron oxidation.	115.0
			G/S/F:0%/ 80%/ 20%		Light gray fine SAND; little Silt; trace Clay; saturated.	
					At 23.6 feet, 0.25-inch thick lens of light brownish gray CLAY.	
			PID:0.5		At 24.1 feet, 1-inch thick lens of light brownish gray CLAY.	
			D/O/S: None/ None/ None			
25.0						112.5
					At 25.2 feet, 2-inch thick lens of light brownish gray CLAY.	
			G/S/F:0%/ 98%/ 2%		Light gray fine SAND; trace Silt; saturated.	
			G/S/F:0%/ 80%/ 20%		Light gray fine SAND; little Silt; trace Clay; loose; saturated.	
			PID:0.9		At 26.4 feet, 4-inch thick lens of SILT; little fine Sand.	
			D/O/S: None/ None/ None			
27.5					At 27.1 feet, 2-inch thick lens of light brownish gray CLAY; firm.	110.0
					At 27.6 and 27.8 feet, 0.25-inch thick lenses of fine SAND.	
			G/S/F:0%/ 98%/ 2%		Light gray fine SAND; trace Silt; 0.25-inch thick lens of CLAY at bottom of unit; saturated.	
			G/S/F:0%/ 80%/ 20%		Light gray fine SAND; little Silt; trace Clay; saturated.	
			PID:0.7			
			D/O/S: None/ None/ None		Light gray fine SAND; trace Silt; firm; orange mottling occuring throughout as lenses; saturated.	
			G/S/F:0%/ 95%/ 5%			
30.0					BLIND DRILLED.	107.5
32.5						105.0
		SG2-AP09-34-35-170123	**G/S/F:**0%/ 95%/ 5%		Pale yellow fine SAND; little medium Sand; trace Silt; loose; saturated.	
35.0					End of boring 35.0 feet	
37.5						
40.0

Aquifer Profiling and Sampling Data Package

Final Data Package for Waterloo Profiling Services

SITE LOCATION: MERRIMACK, NH

Project ID: 205169222

Report Date: November 10, 2016

This project was performed by Cascade Technical Services for C.T. Male Associates.

Prepared for:
C.T. Male Associates

Narrative

Cascade Technical Services (Cascade) is pleased to present this data report to C.T. Male Associates for the Waterloo$^{APS\ TM}$ (APS) services that were provided between the dates of October 17 – November 4, 2016 at your Site in Merrimack, NH.

The results associated with the data and plots presented in this report were generated in accordance to Cascade's Standard Operating Procedures (SOPs) for the APS services.

All APS field work which includes the collection of Index of Hydraulic Conductivity (I_k) data, sample collection, APS equipment calibration, multiparameter sonde calibration and equipment decontamination were completed by trained, scientific professionals and all QA/QC measurements associated with these data were found to be within the tolerances set forth in the SOPs. Exceptions/deviations regarding these data are noted below.

- Location AP01: No samples collected. No I_k data available from 29.55 to 30.50 feet due to an equipment failure. I_k data collected deeper than 87.5 feet below ground surface is questionable due to broken tooling, use data with caution.
- Location AP02: No samples collected.
- Location AP04: No samples collected.

I certify that the data package is in compliance with the terms and conditions of the contract, both technically and for completeness, for other than the conditions detailed above. Release of the data contained in this data package has been authorized by the data manager or her designee, as verified by the following signature.

Signature: Jessica Bulova
